- THE AIR CONDITIONING SYSTEM CONTAINS REFRIGERANT UNDER HIGH PRESSURE. SEVERE PERSONAL INJURY MAY RESULT FROM IMPROPER SERVICE PROCEDURES. REPAIRS SHOULD ONLY BE PERFORMED BY QUALIFIED SERVICE PERSONNEL.

- AVOID BREATHING THE REFRIGERANT AND REFRIGERANT OIL VAPOR OR MIST. EXPOSURE MAY IRRITATE THE EYES, NOSE, AND/OR THROAT. WEAR EYE PROTECTION WHEN SERVICING THE AIR CONDITIONING REFRIGERANT SYSTEM. SERIOUS EYE INJURY CAN RESULT FROM DIRECT CONTACT WITH THE REFRIGERANT. IF EYE CONTACT OCCURS, SEEK MEDICAL ATTENTION IMMEDIATELY.

- DO NOT EXPOSE THE REFRIGERANT TO OPEN FLAME. POISONOUS GAS IS CREATED WHEN REFRIGERANT IS BURNED. AN ELECTRONIC LEAK DETECTOR IS RECOMMENDED.

- IF ACCIDENTAL SYSTEM DISCHARGE OCCURS, VENTILATE THE WORK AREA BEFORE RESUMING SERVICE. LARGE AMOUNTS OF REFRIGERANT RELEASED IN A CLOSED WORK AREA WILL DISPLACE THE OXYGEN AND CAUSE SUFFOCATION.

- THE EVAPORATION RATE OF R-134a REFRIGERANT AT AVERAGE TEMPERATURE AND ALTITUDE IS EXTREMELY HIGH. AS A RESULT, ANYTHING THAT COMES IN CONTACT WITH THE REFRIGERANT WILL FREEZE. ALWAYS PROTECT THE SKIN OR DELICATE OBJECTS FROM DIRECT CONTACT WITH THE REFRIGERANT.

- THE R-134a SERVICE EQUIPMENT OR THE VEHICLE REFRIGERANT SYSTEM SHOULD NOT BE PRESSURE TESTED OR LEAK TESTED WITH COMPRESSED AIR. SOME MIXTURES OF AIR AND R-134a HAVE BEEN SHOWN TO BE COMBUSTIBLE AT ELEVATED PRESSURES. THESE MIXTURES ARE POTENTIALLY DANGEROUS, AND MAY RESULT IN FIRE OR EXPLOSION CAUSING INJURY OR PROPERTY DAMAGE.

DESCRIPTION AND OPERATION (Continued)

CAUTION:

- Liquid refrigerant is corrosive to metal surfaces. Follow the operating instructions supplied with the service equipment being used.
- Never add R-12 to a refrigerant system designed to use R-134a. Damage to the system will result.
- R-12 refrigerant oil must not be mixed with R-134a refrigerant oil. They are not compatible.
- Do not use R-12 equipment or parts on the R-134a system. Damage to the system will result.
- Do not overcharge the refrigerant system. This will cause excessive compressor head pressure and can cause noise and system failure.
- Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.
- Do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.
- The refrigerant system must always be evacuated before charging.
- Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. This will prevent contamination in the system.
- Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system.
- Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug.
- Before connecting an open refrigerant fitting, always install a new seal or gasket. Coat the fitting and seal with clean refrigerant oil before connecting.
- Do not remove the sealing caps from a replacement component until it is to be installed.
- When installing a refrigerant line, avoid sharp bends that may restrict refrigerant flow. Position the refrigerant lines away from exhaust system components or any sharp edges, which may damage the line.
- Tighten refrigerant fittings only to the specified torque. The aluminum fittings used in the refrigerant system will not tolerate overtightening.
- When disconnecting a refrigerant fitting, use a wrench on both halves of the fitting. This will prevent twisting of the refrigerant lines or tubes.

- Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, air-tight, and moisture-free container.

- Keep service tools and the work area clean. Contamination of the refrigerant system through careless work habits must be avoided.

COOLING SYSTEM REQUIREMENTS

To maintain the performance level of the heating-air conditioning system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or condenser will reduce the performance of the air conditioning and engine cooling systems.

The engine cooling system includes the heater core and the heater hoses. Refer to Group 7 - Cooling System for more information before the opening of, or attempting any service to the engine cooling system.

REFRIGERANT HOSES/LINES/TUBES PRECAUTIONS

Kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire system. High pressures are produced in the system when it is operating. Extreme care must be exercised to make sure that all refrigerant system connections are pressure tight.

A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. Sharp bends will reduce the flow of refrigerant. The flexible hose lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold. It is a good practice to inspect all flexible refrigerant system hose lines at least once a year to make sure they are in good condition and properly routed.

There are two types of refrigerant fittings:

- All fittings with O-rings need to be coated with refrigerant oil before installation. Use only O-rings that are the correct size and approved for use with R-134a refrigerant. Failure to do so may result in a leak.

- Unified plumbing connections with gaskets cannot be serviced with O-rings. The gaskets are not reusable and new gaskets do not require lubrication before installing.

Using the proper tools when making a refrigerant plumbing connection is very important. Improper tools or improper use of the tools can damage the refrigerant fittings. Always use two wrenches when loosening or tightening tube fittings. Use one wrench

DESCRIPTION AND OPERATION (Continued)

to hold one side of the connection stationary, while loosening or tightening the other side of the connection with a second wrench.

The refrigerant must be recovered completely from the system before opening any fitting or connection. Open the fittings with caution, even after the refrigerant has been recovered. If any pressure is noticed as a fitting is loosened, tighten the fitting and recover the refrigerant from the system again.

Do not discharge refrigerant into the atmosphere. Use an R-134a refrigerant recovery/recycling device that meets SAE Standard J2210.

The refrigerant system will remain chemically stable as long as pure, moisture-free R-134a refrigerant and refrigerant oil is used. Dirt, moisture, or air can upset this chemical stability. Operational troubles or serious damage can occur if foreign material is present in the refrigerant system.

When it is necessary to open the refrigerant system, have everything needed to service the system ready. The refrigerant system should not be left open to the atmosphere any longer than necessary. Cap or plug all lines and fittings as soon as they are opened to prevent the entrance of dirt and moisture. All lines and components in parts stock should be capped or sealed until they are to be installed.

All tools, including the refrigerant recycling equipment, the manifold gauge set, and test hoses should be kept clean and dry. All tools and equipment must be designed for R-134a refrigerant.

COMPRESSOR - 2.5L VM DIESEL

DESCRIPTION

The 2.5L diesel engine uses a Denso 10PA17 seven cylinder, reciprocating wobble plate-type compressor. This compressor has a fixed displacement of 150 cubic centimeters (9.375 cubic inches), and has both the suction and discharge ports located on the compressor cylinder head. A label identifying the use of R-134a refrigerant is located on the compressor.

OPERATION

The compressor is driven by the engine through the power steering pump main shaft. The power steering pump is driven by the accessory drive belt.

The compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant. The compressor draws in low-pressure refrigerant vapor from the evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the condenser through the compressor discharge port.

The compressor cannot be repaired. If faulty or damaged, the entire compressor assembly must be

replaced. The compressor clutch, pulley and clutch coil are available for service.

COMPRESSOR CLUTCH - 2.5L VM DIESEL

DESCRIPTION

The compressor clutch assembly used on the diesel engine is the same clutch used on most compressors however, due to the different drive arrangement it utilizes a drive cup that threads onto the clutch drive pulley. The basic compressor clutch assembly consists of a stationary electromagnetic coil, a hub bearing and pulley assembly, and a clutch plate (Fig. 1). The electromagnetic coil unit and the hub bearing and pulley assembly are each retained on the nose of the compressor front housing with snap rings. The clutch plate is keyed to the compressor shaft and secured with a nut. These components provide the means to engage and disengage the compressor from the engine serpentine accessory drive belt.

J9524-33

Fig. 1 Compressor Clutch – Drive Cup Not Shown

- 1 – CLUTCH PLATE
- 2 – SHAFT KEY
- 3 – PULLEY
- 4 – COIL
- 5 – CLUTCH SHIMS
- 6 – SNAP RING
- 7 – SNAP RING

OPERATION

When the clutch coil is energized, it magnetically draws the clutch into contact with the pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley. The compressor clutch and coil are the only serviced parts on the compressor.

The compressor clutch engagement is controlled by several components: the heater-A/C mode control switch, the low pressure cycling clutch switch, the dual function high pressure switch, the compressor

DESCRIPTION AND OPERATION (Continued)

clutch relay, and the Powertrain Control Module (PCM). The PCM may delay compressor clutch engagement for up to thirty seconds. Refer to Group 14 - Fuel System for more information on the PCM controls.

REMOVAL AND INSTALLATION

SUCTION AND DISCHARGE LINE

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS GROUP BEFORE PERFORMING THE FOLLOWING OPERATION.

LEFT-HAND DRIVE

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. See Refrigerant Recovery in this group for the procedures.

(3) Unplug the wire harness connector from the high pressure cut-off switch.

(4) Disconnect the discharge line refrigerant line fitting from the condenser inlet tube (Fig. 2). See Refrigerant Line Coupler in this group for the procedures. Install plugs in, or tape over all of the opened refrigerant line fittings.

(5) Remove the nut that secures the suction line block fitting to the accumulator outlet. Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) Remove the screw that secures the suction and discharge line manifold to the compressor. Install plugs in, or tape over all of the opened refrigerant line fittings.

Fig. 2 Suction and Discharge Line Remove/Install - Left-Hand Drive

- 2 - SCREW
- 3 - COMPRESSOR
- 4 - CONDENSER
- 5 - INLET
- 6 - CLIP
- 7 - HEX NUT
- 8 - ACCUMULATOR

(7) Remove the suction and discharge line assembly from the vehicle.

INSTALLATION

(1) Remove the tape or plugs from the suction and discharge line manifold and the compressor. Install the suction and discharge line manifold to the compressor. Tighten the mounting screw to 28 N·m (250 in. lbs.).

(2) Remove the tape or plugs from the suction line and the accumulator outlet block fittings. Install the suction line to the accumulator outlet and tighten the mounting nut to 9 N·m (80 in. lbs.).

(3) Remove the tape or plugs from the refrigerant line fittings on the discharge line and the condenser inlet tube. Connect the discharge line refrigerant line coupler to the condenser inlet tube. See Refrigerant Line Coupler in this group for the procedures.

(4) Plug in the wire harness connector to the high pressure cut-off switch.

(5) Connect the battery negative cable.

REMOVAL AND INSTALLATION (Continued)

(6) Evacuate the refrigerant system. See Refrigerant System Evacuate in this group for the procedures.

(7) Charge the refrigerant system. See Refrigerant System Charge in this group for the procedures.

RIGHT-HAND DRIVE - 2.5L ENGINE

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. See Refrigerant Recovery in this group for the procedures.

(3) Unplug the wire harness connector from the high pressure cut-off switch.

(4) Disconnect the discharge line refrigerant line fitting from the condenser inlet tube (Fig. 3). See Refrigerant Line Coupler in this group for the procedures. Install plugs in, or tape over all of the opened refrigerant line fittings.

(5) Remove the nut that secures the suction line block fitting to the accumulator outlet. Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) Remove the screw that secures the suction and discharge line manifold to the compressor. Install plugs in, or tape over all of the opened refrigerant line fittings.

(7) Remove the suction and discharge line assembly from the vehicle.

INSTALLATION

(1) Remove the tape or plugs from the suction and discharge line manifold and the compressor. Install the suction and discharge line manifold to the compressor. Tighten the mounting screw to 28 N·m (250 in. lbs.).

(2) Remove the tape or plugs from the suction line and the accumulator outlet block fittings. Install the suction line to the accumulator outlet and tighten the mounting nut to 9 N·m (80 in. lbs.).

80b0d738

- 6 - INLET
- 7 - CLIP
- 8 - SUCTION AND DISCHARGE LINE

(3) Remove the tape or plugs from the refrigerant line fittings on the discharge line and the condenser inlet tube. Connect the discharge line refrigerant line coupler to the condenser inlet tube. See Refrigerant Line Coupler in this group for the procedures.

(4) Plug in the wire harness connector to the high pressure cut-off switch.

(5) Connect the battery negative cable.

(6) Evacuate the refrigerant system. See Refrigerant System Evacuate in this group for the procedures.

(7) Charge the refrigerant system. See Refrigerant System Charge in this group for the procedures.

REMOVAL AND INSTALLATION (Continued)

RIGHT-HAND DRIVE - 4.0L ENGINE

The suction and discharge lines for this model are individual components and are secured to a manifold block on the compressor with block fittings (Fig. 4). There is also a jumper line installed between the discharge line and the condenser inlet that is secured with refrigerant line couplers at each end. Each of these components is available as a separate service part.

The suction and discharge line components can be removed from or installed on the vehicle individually, or as a unit. Otherwise, the service procedures are the same as those for the other applications. Tighten the additional mounting hardware as follows:

- Suction line to manifold block nut - 9 N-m (80 in. lbs.)
- Discharge line to manifold block nut - 9 N-m (80 in. lbs.)

- Manifold block to compressor screw - 28 N-m (250 in. lbs.).

COMPRESSOR - 2.5L VM DIESEL**REMOVAL**

- (1) Disconnect the negative battery cable.
- (2) Recover the refrigerant. See Refrigerant Recovery in this group for the procedure.
- (3) Disconnect the A/C compressor clutch electrical connector (Fig. 5).
- (4) Remove the suction and discharge refrigerant line retaining bolts from the compressor and plug the openings.
- (5) Raise the vehicle on a hoist.
- (6) Loosen all (4) H-block retaining bolts. Do not remove at this time.

- 2 - LEFT ENGINE MOUNT THROUGH BOLT NUT
- 3 - H BLOCK BOLTS
- 4 - COUPLER PINCH BOLT
- 5 - COMPRESSOR ELECTRICAL CONNECTOR

NOTE: Mark the H-Block position in relation to the power steering pump so it may be reinstalled in the same position.

(7) Remove the (2) H-block bolts from the power steering pump side of the block (Fig. 5).

(8) Remove the serpentine drive belt. Refer to Group 7, Cooling System for the procedure.

(9) Loosen, but do not remove, the coupler pinch bolt and slide the coupler towards the pump (Fig. 5).

NOTE: There are 4 spacers located between the engine block and the A/C compressor. The doweled spacers are located in the front, undoweled in the rear.

(10) Remove the (4) A/C compressor retaining bolts (Fig. 5).

(11) Remove the compressor assembly from the vehicle with H-Block attached.

CAUTION: Check the refrigerant oil level in the new compressor prior to installation. See compressor oil level in this group for a detailed procedure.

INSTALLATION

(1) Transfer the H-Block to the new compressor and leave the bolts loose at this time.

(2) Lift the A/C compressor in position and install the (4) spacers and retaining bolts (Fig. 6). Torque the bolts to 33 N·m (25 ft. lbs.).

**Fig. 6 A/C Compressor Position & Orientation**

- 1 - A/C COMPRESSOR MOUNTING BOLTS
- 2 - LEFT ENGINE MOUNT THROUGH BOLT NUT
- 3 - H BLOCK BOLTS
- 4 - COUPLER PINCH BOLT
- 5 - COMPRESSOR ELECTRICAL CONNECTOR

(3) Slide the drive coupler into its original position and start the remaining (2) H-Block bolts (Fig. 6).

(4) Install the serpentine drive belt. See Group 7, Cooling System for the procedure.

(5) Torque all H-Block retaining bolts to 33 N·m (25 ft. lbs.).

(6) Lower the vehicle from the hoist.

(7) Install the suction and discharge refrigerant lines on the compressor, making sure the o-rings are well lubricated with refrigerant oil and free of tears.

(8) Connect the A/C compressor electrical connector (Fig. 6).

(9) Connect the negative battery cable.

(10) Charge the refrigerant system. See Refrigerant System Charge in this group for procedure.

REMOVAL AND INSTALLATION (Continued)

COMPRESSOR CLUTCH - 2.5L VM DIESEL

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the compressor from the vehicle. Refer to the procedure in this group.

(3) Unscrew the compressor drive cup from the clutch pulley.

(4) Insert the two pins of the spanner wrench (Special Tool C-4489) into the holes of the clutch plate. Hold the clutch plate stationary and remove the hex nut (Fig. 7).

Fig. 7 Clutch Nut Remove

- 1 - CLUTCH PLATE
2 - SPANNER

(5) Remove the clutch plate with a puller (Special Tool C-6461) (Fig. 8).

Fig. 8 Clutch Plate Remove

- 1 - CLUTCH PLATE PULLER
2 - CLUTCH PLATE

(6) Remove the compressor shaft key and the clutch shims.

(7) Remove the external front housing snap ring with snap ring pliers (Fig. 9).

Fig. 9 External Snap Ring Remove

- 1 - PULLEY
2 - SNAP RING PLIERS

(8) Install the lip of the rotor puller (Special Tool C-6141-1) into the snap ring groove exposed in the previous step, and install the shaft protector (Special Tool C-6141-2) (Fig. 10).

Fig. 10 Shaft Protector and Puller

- 1 - PULLER JAW
2 - SHAFT PROTECTOR

REMOVAL AND INSTALLATION (Continued)

(9) Install the puller through-bolts (Special Tool C-6461) through the puller flange and into the jaws of the rotor puller and tighten (Fig. 11). Turn the puller center bolt clockwise until the rotor pulley is free.

Fig. 11 Install Puller Plate

- 1 - PULLER JAW
2 - PULLER

(10) Remove the screw and retainer from the clutch coil lead wire harness on the compressor front housing (Fig. 12).

Fig. 12 Clutch Coil Lead Wire Harness

- 1 - COIL
2 - COIL WIRE
3 - RETAINER SCREW

(11) Remove the snap ring from the compressor hub and remove the clutch field coil (Fig. 13). Slide the clutch field coil off of the compressor hub.

Fig. 13 Clutch Field Coil Snap Ring Remove

- 1 - COIL
2 - SNAP RING PLIERS

INSPECTION

Examine the friction surfaces of the clutch pulley and the front plate for wear. The pulley and front plate should be replaced if there is excessive wear or scoring.

If the friction surfaces are oily, inspect the shaft and nose area of the compressor for oil. Remove the felt from the front cover. If the felt is saturated with oil, the shaft seal is leaking and the compressor must be replaced.

Check the clutch pulley bearing for roughness or excessive leakage of grease. Replace the bearing, if required.

INSTALLATION

- (1) Install the clutch field coil and snap ring.
- (2) Install the clutch coil lead wire harness retaining clip on the compressor front housing and tighten the retaining screw.
- (3) Align the rotor assembly squarely on the front compressor housing hub.
- (4) Install the pulley bearing assembly with the installer (Special Tool C-6871) (Fig. 14). Thread the installer on the shaft, then turn the nut until the pulley assembly is seated.
- (5) Install the external front snap ring with snap ring pliers. The bevel side of the snap ring must be facing outward. Press the snap ring to make sure it is properly seated in the groove.

REMOVAL AND INSTALLATION (Continued)

**Fig. 14 Clutch Pulley Install**

- 1 - PULLEY BEARING ASSEMBLY
2 - INSTALLER

CAUTION: If the snap ring is not fully seated in the groove it will vibrate out, resulting in a clutch failure and severe damage to the front housing of the compressor.

(6) Install the compressor shaft key and the original clutch shims on the compressor shaft.

(7) Install the clutch plate with the driver (Special Tool C-6463) (Fig. 15). Install the shaft hex nut and tighten to 14.4 N·m (10.5 ft. lbs.).

**Fig. 15 Clutch Plate Driver**

- 1 - CLUTCH PLATE
2 - DRIVER

(8) Check the clutch air gap with a feeler gauge (Fig. 16). If the air gap does not meet the specification, add or subtract shims as required. The air gap specification is 0.41 to 0.79 millimeter (0.016 to 0.031 inch). If the air gap is not consistent around the circumference of the clutch, lightly pry up at the minimum variations. Lightly tap down at the points of maximum variation.

J8924-28

Fig. 16 Check Clutch Air Gap

- 1 - FEELER GAUGE

NOTE: The air gap is determined by the spacer shims. When installing an original, or a new clutch assembly, try the original shims first. When installing a new clutch onto a compressor that previously did not have a clutch, use 1.0, 0.50, and 0.13 millimeter (0.040, 0.020, and 0.005 inch) shims from the clutch hardware package that is provided with the new clutch.

(9) Reverse the remaining removal procedures to complete the installation.

CLUTCH BREAK-IN

After a new compressor clutch has been installed, cycle the compressor clutch approximately twenty times (five seconds on, then five seconds off). During this procedure, set the heater-A/C control to the Recirculation Mode, the blower motor switch in the highest speed position, and the engine speed at 1500 to 2000 rpm. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher compressor clutch torque capability.

DESCRIPTION AND OPERATION

EMISSION SYSTEM

OPERATION

The Powertrain Control Module (PCM) monitors many different circuits in the fuel injection, ignition, emission and engine systems. If the PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the PCM's memory. If the code applies to a non-emissions related component or system, and the problem is repaired or ceases to exist, the PCM cancels the code after 40 warm-up cycles. Diagnostic trouble codes that affect vehicle emissions illuminate the Malfunction Indicator Lamp (MIL). The MIL is displayed as an engine icon on the instrument panel. Refer to Malfunction Indicator Lamp (MIL) in this section.

Certain criteria must be met before the PCM stores a DTC in memory. The criteria may be a specific range of engine RPM, engine temperature, and/or input voltage to the PCM.

The PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example**, assume the

diagnostic trouble code criteria requires the PCM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the PCM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the PCM will not store a DTC.

There are several operating conditions for which the PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits in this section.

Technicians must retrieve stored DTC's by connecting the DRB scan tool (or an equivalent scan tool) to the 16-way data link connector (Fig. 1).

NOTE: Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, pulling a spark plug wire to perform a spark test may set the misfire code. When a repair is completed and verified, connect the DRB scan tool to the 16-way data link connector to erase all DTC's and extinguish the MIL.

DESCRIPTION AND OPERATION (Continued)

Fig. 1 Data Link (Diagnostic) Connector Location

1 - 16-WAY DATA LINK CONNECTOR

MALFUNCTION INDICATOR LAMP (MIL)

DESCRIPTION

The Malfunction Indicator Lamp (MIL) is located on the instrument panel. It is displayed as an engine icon (graphic).

OPERATION

As a functional test, the MIL illuminates at key-on before engine cranking. Whenever the Powertrain Control Module (PCM) sets a Diagnostic Trouble Code (DTC) that affects vehicle emissions, it illuminates the MIL. If a problem is detected, the PCM sends a message to the instrument cluster to illuminate the lamp. The PCM illuminates the MIL only for DTC's that affect vehicle emissions. There are some monitors that may take two consecutive trips, with a detected fault, before the MIL is illuminated. The MIL stays on continuously when the PCM has entered a Limp-In mode or identified a failed emission component. Refer to the Diagnostic Trouble Code charts in this group for emission related codes.

Also, the MIL either flashes or illuminates continuously when the PCM detects active engine misfire. Refer to Misfire Monitoring in this section.

Additionally, the PCM may reset (turn off) the MIL when one of the following occur:

- PCM does not detect the malfunction for 3 consecutive trips (except misfire and Fuel system Monitors).
- PCM does not detect a malfunction while performing three successive engine misfire or fuel system tests. The PCM performs these tests while the engine is operating within ± 375 RPM of and within

10 % of the load of the operating condition at which the malfunction was first detected.

STATE DISPLAY TEST MODE

OPERATION

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. Connect the DRB scan tool to the data link connector and access the state display screen. Then access either State Display Inputs and Outputs or State Display Sensors.

CIRCUIT ACTUATION TEST MODE

OPERATION

The Circuit Actuation Test Mode checks for proper operation of output circuits or devices the Powertrain Control Module (PCM) may not internally recognize. The PCM attempts to activate these outputs and allow an observer to verify proper operation. Most of the tests provide an audible or visual indication of device operation (click of relay contacts, fuel spray, etc.). Except for intermittent conditions, if a device functions properly during testing, assume the device, its associated wiring, and driver circuit work correctly. Connect the DRB scan tool to the data link connector and access the Actuators screen.

DIAGNOSTIC TROUBLE CODES

OPERATION

A Diagnostic Trouble Code (DTC) indicates that the Powertrain Control Module (PCM) has recognized an abnormal condition in the system.

DTC's are the results of a system or circuit failure, but do not directly identify the failed component or components.

Technicians must retrieve stored DTC's by connecting the DRB III scan tool (or an equivalent scan tool) to the 16-way data link connector. This connector is located on the lower edge of the instrument panel near the steering column.

OBTAINING DTC's

WARNING: APPLY PARKING BRAKE AND/OR BLOCK WHEELS BEFORE PERFORMING ANY TEST ON AN OPERATING ENGINE.

DESCRIPTION AND OPERATION (Continued)

(1) Connect the DRB scan tool to data link (diagnostic) connector.

(2) Turn the ignition switch on, access Read Fault Screen. Record all the DTC's shown on the DRB scan tool.

(3) To erase DTC's, use the Erase Trouble Code data screen on the DRB scan tool.

NOTE: For a list of DTC's, refer to the following charts.

DIAGNOSTIC TROUBLE CODE DESCRIPTIONS

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC

P0123 (M)	Throttle Position Sensor Voltage High	Throttle position sensor input above the maximum acceptable voltage.
P0123 (M)	Accelerator Position Sensor (APPS) Signal Voltage Too High	APPS voltage input above the maximum acceptable voltage.
P0125 (M)	Closed Loop Temp Not Reached	Time to enter Closed Loop Operation (Fuel Control) is excessive.
P0125 (M)	Engine is Cold Too Long	Engine does not reach operating temperature.
P0130 (M)	1/1 O2 Sensor Heater Circuit Malfunction	Oxygen sensor heater element malfunction.

DESCRIPTION AND OPERATION (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
P0131 (M)	1/1 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.
P0132 (M)	1/1 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage maintained above normal operating range.
P0133 (M)	1/1 O2 Sensor Slow Response	Oxygen sensor response slower than minimum required switching frequency.
P0134 (M)	1/1 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor input.
P0135 (M)	1/1 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.
P0136 (M)	1/2 O2 Sensor Heater Circuit Malfunction	Oxygen sensor heater element malfunction.
P0137 (M)	1/2 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.
P0138 (M)	1/2 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage maintained above normal operating range.
P0139 (M)	1/2 O2 Sensor Slow Response	Oxygen sensor response not as expected.
P0140 (M)	1/2 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor.
P0141 (M)	1/2 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.
P0143 (M)	1/3 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.
P0144 (M)	1/3 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage maintained above normal operating range.
P0145 (M)	1/3 O2 Sensor Slow Response	Oxygen sensor response slower than minimum required switching frequency.
P0146 (M)	1/3 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor.
P0147 (M)	1/3 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.
P0151 (M)	2/1 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.
P0152 (M)	2/1 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage sustained above normal operating range.
P0153 (M)	2/1 O2 Sensor Slow Response	Oxygen sensor response slower than minimum required switching frequency.
P0154 (M)	2/1 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor.
P0155 (M)	2/1 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.
P0157 (M)	2/2 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.
P0158 (M)	2/2 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage maintained above normal operating range.
P0159	2/2 O2 Sensor Slow Response	Oxygen sensor response slower than minimum required switching frequency.
P0160 (M)	2/2 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor.

DESCRIPTION AND OPERATION (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
P0161 (M)	2/2 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.
P0168	Decreased Engine Performance Due To High Injection Pump Fuel Temp	Fuel temperature is above the engine protection limit. Engine power will be derated.
P0171 (M)	1/1 Fuel System Lean	A lean air/fuel mixture has been indicated by an abnormally rich correction factor.
P0172 (M)	1/1 Fuel System Rich	A rich air/fuel mixture has been indicated by an abnormally lean correction factor.
P0174 (M)	2/1 Fuel System Lean	A lean air/fuel mixture has been indicated by an abnormally rich correction factor.
P0175 (M)	2/1 Fuel System Rich	A rich air/fuel mixture has been indicated by an abnormally lean correction factor.
P0176	Loss of Flex Fuel Calibration Signal	No calibration voltage present from flex fuel sensor.
P0177	Water In Fuel	Excess water found in fuel by water-in-fuel sensor.
P0178	Flex Fuel Sensor Volts Too Low	Flex fuel sensor input below minimum acceptable voltage.
P0178	Water In Fuel Sensor Voltage Too Low	Loss of water-in-fuel circuit or sensor.
P0179	Flex Fuel Sensor Volts Too High	Flex fuel sensor input above maximum acceptable voltage.
P0181	Fuel Injection Pump Failure	Low power, engine derated, or engine stops.
P0182 (M)	CNG Temp Sensor Voltage Too Low	Compressed natural gas temperature sensor voltage below acceptable voltage.
P0183 (M)	CNG Temp Sensor Voltage Too High	Compressed natural gas temperature sensor voltage above acceptable voltage.
P0201 (M)	Injector #1 Control Circuit	An open or shorted condition detected in control circuit for injector #1 or the INJ 1 injector bank.
P0202 (M)	Injector #2 Control Circuit	An open or shorted condition detected in control circuit for injector #2 or the INJ 2 injector bank.
P0203 (M)	Injector #3 Control Circuit	An open or shorted condition detected in control circuit for injector #3 or the INJ 3 injector bank.
P0204 (M)	Injector #4 Control Circuit	Injector #4 or INJ 4 injector bank output driver stage does not respond properly to the control signal.
P0205 (M)	Injector #5 Control Circuit	Injector #5 output driver stage does not respond properly to the control signal.
P0206 (M)	Injector #6 Control Circuit	Injector #6 output driver stage does not respond properly to the control signal.
P0207 (M)	Injector #7 Control Circuit	Injector #7 output driver stage does not respond properly to the control signal.
P0208 (M)	Injector #8 Control Circuit	Injector #8 output driver stage does not respond properly to the control signal.
P0209 (M)	Injector #9 Control Circuit	Injector #9 output driver stage does not respond properly to the control signal.
P0210 (M)	Injector #10 Control Circuit	Injector #10 output driver stage does not respond properly to the control signal.
P0215	Fuel Injection Pump Control Circuit	Failure in fuel pump relay control circuit.

DESCRIPTION AND OPERATION (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
P0216 (M)	Fuel Injection Pump Timing Failure	High fuel supply restriction, low fuel pressure or possible wrong or incorrectly installed pump keyway.
P0217	Decreased Engine Performance Due To Engine Overheat Condition	Engine overheating. ECM will derate engine performance.
P0219	Crankshaft Position Sensor Overspeed Signal	Engine has exceeded rpm limits.
P0222 (M)	Idle Validation Signals Both Low	Problem detected with idle validation circuits within APPS.
P0223 (M)	Idle Validation Signals Both High (Above 5 Volts)	Problem detected with idle validation circuits within APPS.
P0230	Transfer Pump (Lift Pump) Circuit Out of Range	Problem detected in fuel transfer pump circuits.
P0232	Fuel Shutoff Signal Voltage Too High	Fuel shut-off signal voltage too high from ECM to fuel injection pump.
P0234 (M)	Turbo Boost Limit Exceeded	Problem detected in turbocharger wastegate.
P0236 (M)	Map Sensor Too High Too Long	Problem detected in turbocharger wastegate.
P0237 (M)	Map Sensor Voltage Too Low	MAP sensor voltage input below the minimum acceptable voltage.
P0238 (M)	Map Sensor Voltage Too High	MAP sensor voltage input above the maximum acceptable voltage.
P0251 (M)	Fuel Inj. Pump Mech. Failure Fuel Valve Feedback Circuit	Problem sensed with fuel circuit internal to fuel injection pump.
P0253 (M)	Fuel Injection Pump Fuel Valve Open Circuit	Problem sensed with fuel circuit internal to fuel injection pump.
P0254	Fuel Injection Pump Fuel Valve Current Too High	Problem caused by internal fuel injection pump failure.
P0300 (M)	Multiple Cylinder Mis-fire	Misfire detected in multiple cylinders.
P0301 (M)	CYLINDER #1 MISFIRE	Misfire detected in cylinder #1.
P0302 (M)	CYLINDER #2 MISFIRE	Misfire detected in cylinder #2.
P0303 (M)	CYLINDER #3 MISFIRE	Misfire detected in cylinder #3.
P0304 (M)	CYLINDER #4 MISFIRE	Misfire detected in cylinder #4.
P0305 (M)	CYLINDER #5 MISFIRE	Misfire detected in cylinder #5.
P0306 (M)	CYLINDER #6 MISFIRE	Misfire detected in cylinder #6.
P0307 (M)	CYLINDER #7 MISFIRE	Misfire detected in cylinder #7.
P0308 (M)	CYLINDER #8 MISFIRE	Misfire detected in cylinder #8.
P0309 (M)	CYLINDER #9 MISFIRE	Misfire detected in cylinder #9.
P0310 (M)	CYLINDER #10 MISFIRE	Misfire detected in cylinder #10.
P0320 (M)	No Crank Reference Signal at PCM	No reference signal (crankshaft position sensor) detected during engine cranking.
P0320 (M)	No RPM Signal to PCM (Crankshaft Position Sensor Signal to JTEC)	A CKP signal has not been detected at the PCM.
P0325	Knock Sensor #1 Circuit	Knock sensor (#1) signal above or below minimum acceptable threshold voltage at particular engine speeds.

DESCRIPTION AND OPERATION (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
P0330	Knock Sensor #2 Circuit	Knock sensor (#2) signal above or below minimum acceptable threshold voltage at particular engine speeds.
P0336 (M)	Crankshaft Position (CKP) Sensor Signal	Problem with voltage signal from CKP.
P0340 (M)	No Cam Signal At PCM	No fuel sync
P0341 (M)	Camshaft Position (CMP) Sensor Signal	Problem with voltage signal from CMP.
P0350	Ignition Coil Draws Too Much Current	A coil (1-5) is drawing too much current.
P0351 (M)	Ignition Coil # 1 Primary Circuit	Peak primary circuit current not achieved with maximum dwell time.
P0352 (M)	Ignition Coil # 2 Primary Circuit	Peak primary circuit current not achieved with maximum dwell time.
P0353 (M)	Ignition Coil # 3 Primary Circuit	Peak primary circuit current not achieved with maximum dwell time.
P0354 (M)	Ignition Coil # 4 Primary Circuit	Peak primary circuit current not achieved with maximum dwell time (High Impedance).
P0355 (M)	Ignition Coil # 5 Primary Circuit	Peak primary circuit current not achieved with maximum dwell time (High Impedance).
P0356 (M)	Ignition Coil # 6 Primary Circuit	Peak primary circuit current not achieved with maximum dwell time (high impedance).
P0357 (M)	Ignition Coil # 7 Primary Circuit	Peak primary circuit current not achieved with maximum dwell time (high impedance).
P0358 (M)	Ignition Coil # 8 Primary Circuit	Peak primary circuit current not achieved with maximum dwell time (high impedance).
P0370	Fuel Injection Pump Speed/Position Sensor Sig Lost	Problem caused by internal fuel injection pump failure.
P0380 (M)	Intake Air Heater Relay #1 Control Circuit	Problem detected in #1 air heater solenoid/relay circuit (not heater element)
P0381 (M)	Wait To Start Lamp Inoperative	Problem detected in wait-to-start bulb circuit.
P0382 (M)	Intake Air Heater Relay #2 Control Circuit	Problem detected in #2 air heater solenoid/relay circuit (not heater element)
P0387	Crankshaft Position Sensor Supply Voltage Too Low	CKP sensor voltage input below the minimum acceptable voltage.
P0388	Crankshaft Position Sensor Supply Voltage Too High	CKP sensor voltage input above the maximum acceptable voltage.
P0401	EGR System Failure	Required change in air/fuel ration not detected during diagnostic test.
P0403	EGR Solenoid Circuit	An open or shorted condition detected in the EGR solenoid control circuit.
P0404	EGR Position Sensor Rationality	EGR position sensor signal does not correlate to EGR duty cycle.
P0405	EGR Position Sensor Volts Too Low	EGR position sensor input below the acceptable voltage range.

DESCRIPTION AND OPERATION (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
P0406	EGR Position Sensor Volts Too High	EGR position sensor input above the acceptable voltage range.
P0412	Secondary Air Solenoid Circuit	An open or shorted condition detected in the secondary air (air switching/aspirator) solenoid control circuit.
P0420 (M)	1/1 Catalytic Converter Efficiency	Catalyst 1/1 efficiency below required level.
P0432 (M)	1/2 Catalytic Converter Efficiency	Catalyst 2/1 efficiency below required level.
P0441 (M)	Evap Purge Flow Monitor	Insufficient or excessive vapor flow detected during evaporative emission system operation.
P0442 (M)	Evap Leak Monitor Medium Leak Detected	A small leak has been detected in the evaporative system.
P0443 (M)	Evap Purge Solenoid Circuit	An open or shorted condition detected in the EVAP purge solenoid control circuit.
P0455 (M)	Evap Leak Monitor Large Leak Detected	A large leak has been detected in the evaporative system.
P0456 (M)	Evap Leak Monitor Small Leak Detected	Leak has been detected in the evaporative system.
P0460	Fuel Level Unit No Change Over Miles	During low fuel
P0460	Fuel Level Unit No Change Over Miles	Fuel level sending unit voltage does not change for more than 40 miles.
P0462	Fuel Level Sending Unit Volts Too Low	Fuel level sensor input below acceptable voltage.
P0462 (M)	Fuel Level Sending Unit Volts Too Low	Open circuit between PCM and fuel gauge sending unit.
P0463	Fuel Level Sending Unit Volts Too High	Fuel level sensor input above acceptable voltage.
P0463 (M)	Fuel Level Sending Unit Volts Too High	Circuit shorted to voltage between PCM and fuel gauge sending unit.
P0500 (M)	No Vehicle Speed Sensor Signal	No vehicle speed sensor signal detected during road load conditions.
P0500 (M)	No Vehicle Speed Sensor Signal	A vehicle speed signal was not detected.
P0505 (M)	Idle Air Control Motor Circuits	SBEC II
P0522	Oil Pressure Voltage Too Low	Oil pressure sending unit (sensor) voltage input below the minimum acceptable voltage.
P0523	Oil Pressure Voltage Too High	Oil pressure sending unit (sensor) voltage input above the maximum acceptable voltage.
P0524	Oil Pressure Too Low	Engine oil pressure is low. Engine power derated.
P0545	A/C Clutch Relay Circuit	Problem detected in air conditioning clutch relay control circuit.
P0551	Power Steering Switch Failure	Incorrect input state detected for the power steering switch circuit. PL: High pressure seen at high speed.
P0562	Charging System Voltage Too Low	Supply voltage sensed at ECM too low.
P0563	Charging System Voltage Too High	Supply voltage sensed at ECM too high.

DESCRIPTION AND OPERATION (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
P0600	PCM Failure SPI Communications	No communication detected between co-processors in the control module.
P0601 (M)	Internal Controller Failure	Internal control module fault condition (check sum) detected.
P0602 (M)	ECM Fueling Calibration Error	ECM Internal fault condition detected.
P0604	RAM Check Failure	Transmission control module RAM self test fault detected. -Aisin transmission
P0605	ROM Check Failure	Transmission control module ROM self test fault detected -Aisin transmission
P0606 (M)	ECM Failure	ECM Internal fault condition detected.
P0615	Starter Relay Control Circuit	An open or shorted condition detected in the starter relay control circuit.
P0622 (G)	Generator Field Not Switching Properly	An open or shorted condition detected in the generator field control circuit.
P0645	A/C Clutch Relay Circuit	An open or shorted condition detected in the A/C clutch relay control circuit.
P0700	EATX Controller DTC Present	This SBEC III or JTEC DTC indicates that the EATX or Aisin controller has an active fault and has illuminated the MIL via a CCD (EATX) or SCI (Aisin) message. The specific fault must be acquired from the EATX via CCD or from the Aisin via ISO-9141.
P0703	Brake Switch Stuck Pressed or Released	Incorrect input state detected in the brake switch circuit. (Changed from P1595)
P0711 (M)	Trans Temp Sensor, No Temp Rise After Start	Relationship between the transmission temperature and overdrive operation and/or TCC operation indicates a failure of the Transmission Temperature Sensor. OBD II Rationality. Was MIL code 37.
P0712	Trans Temp Sensor Voltage Too Low	Transmission fluid temperature sensor input below acceptable voltage. Was MIL code 37.
P0712 (M)	Trans Temp Sensor Voltage Too Low	Voltage less than 1.55 volts (4-speed auto. trans. only).
P0713	Trans Temp Sensor Voltage Too High	Transmission fluid temperature sensor input above acceptable voltage. Was MIL code 37.
P0713 (M)	Trans Temp Sensor Voltage Too High	Voltage greater than 3.76 volts (4-speed auto. trans. only).
P0720 (M)	Low Output SPD Sensor RPM, Above 15 MPH	The relationship between the Output Shaft Speed Sensor and vehicle speed is not within acceptable limits.
P0720 (M)	Low Output Spd Sensor RPM Above 15 mph	Output shaft speed is less than 60 rpm with vehicle speed above 15 mph (4-speed auto. trans. only).
P0740 (M)	Torq Con Clu, No RPM Drop at Lockup	Relationship between engine and vehicle speeds indicated failure of torque converter clutch lock-up system (TCC/PTU solenoid)
P0743 (M)	Torque Converter Clutch Solenoid/ Trans Relay Circuits	An open or shorted condition detected in the torque converter clutch (part throttle unlock) solenoid control circuit. Shift solenoid C electrical fault - Aisin transmission

DESCRIPTION AND OPERATION (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
P0743 (M)	Torque Converter Clutch Solenoid/ Trans Relay Circuits	An open or shorted condition detected in the torque converter part throttle unlock solenoid control circuit (3 or 4-speed auto. trans. only).
P0748 (M)	Governor Pressur Sol Control/Trans Relay Circuits	An open or shorted condition detected in the Governor Pressure Solenoid circuit or Trans Relay Circuit in JTEC RE transmissions.
P0748 (M)	Governor Pressure Sol Control/Trans Relay Circuits	An open or shorted condition detected in the governor pressure solenoid or relay circuits (4-speed auto. trans. only).
P0751 (M)	O/D Switch Pressed (Lo) More Than 5 Minutes	Overdrive override switch input is in a prolonged depressed state.
P0751 (M)	O/D Switch Pressed (LO) More Than 5 Min	Overdrive Off switch input too low for more than 5 minutes (4-speed auto. trans. only).
P0753 (M)	Trans 3-4 Shift Sol/Trans Relay Circuits	An open or shorted condition detected in the overdrive solenoid control circuit or Trans Relay Circuit in JTEC RE transmissions. Was MIL code 45.
P0753 (M)	Trans 3-4 Shift Sol/Trans Relay Circuits	An open or shorted condition detected in the transmission 2-4 shift solenoid circuit (4-speed auto. trans. only).
P0756	AW4 Shift Sol B (2-3) Functional Failure	Shift solenoid B (2-3) functional fault - Aisin transmission
P0783 (M)	3-4 Shift Sol, No RPM Drop at Lockup	The overdrive solenoid is unable to engage the gear change from 3rd gear to the overdrive gear.
P0801	Reverse Gear Lockout Circuit Open or Short	An open or shorted condition detected in the transmission reverse gear lock-out solenoid control circuit.
P0830	Clutch Depressed Switch Circuit	Problem detected in clutch switch circuit.
P0833	Clutch Released Switch Circuit	Problem detected in clutch switch circuit.
P1110	Decrease Engine Performance Due To High Intake Air Temperature	Intake manifold air temperature is above the engine protection limit. Engine power will be derated.
P1180	Decreased Engine Performance Due To High Injection Pump Fuel Temp	Fuel temperature is above the engine protection limit. Engine power will be derated.
P1195 (M)	1/1 O2 Sensor Slow During Catalyst Monitor	A slow switching oxygen sensor has been detected in bank 1/1 during catalyst monitor test. (Also see SCI DTC \$66) (was P0133)
P1196 (M)	2/1 O2 Sensor Slow During Catalyst Monitor	A slow switching oxygen sensor has been detected in bank 2/1 during catalyst monitor test. (Also see SCI DTC \$7A) (was P0153)
P1197	1/2 O2 Sensor Slow During Catalyst Monitor	A slow switching oxygen sensor has been detected in bank 1/2 during catalyst monitor test. (Also see SCI DTC \$68) (was P0139)
P1198	Radiator Temperature Sensor Volts Too High	Radiator coolant temperature sensor input above the maximum acceptable voltage.
P1199	Radiator Temperature Sensor Volts Too Low	Radiator coolant temperature sensor input below the minimum acceptable voltage.
P1281	Engine is Cold Too Long	Engine coolant temperature remains below normal operating temperatures during vehicle travel (Thermostat).

DESCRIPTION AND OPERATION (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
P1282	Fuel Pump Relay Control Circuit	An open or shorted condition detected in the fuel pump relay control circuit.
P1283	Idle Select Signal Invalid	ECM or fuel injection pump module internal fault condition detected.
P1284 (M)	Fuel Injection Pump Battery Voltage Out-Of-Range	Fuel injection pump module internal fault condition detected. Engine power will be derated.
P1285 (M)	Fuel Injection Pump Controller Always On	Fuel injection pump module relay circuit failure detected. Engine power will be derated.
P1286	Accelerator Position Sensor (APPS) Supply Voltage Too High	High voltage detected at APPS.
P1287	Fuel Injection Pump Controller Supply Voltage Low	ECM or fuel injection pump module internal fault condition detected. Engine power will be derated.
P1288	Intake Manifold Short Runner Solenoid Circuit	An open or shorted condition detected in the short runner tuning valve circuit.
P1289	Manifold Tune Valve Solenoid Circuit	An open or shorted condition detected in the manifold tuning valve solenoid control circuit.
P1290	CNG Fuel System Pressure Too High	Compressed natural gas system pressure above normal operating range.
P1291	No Temp Rise Seen From Intake Heaters	Energizing Heated Air Intake does not change intake air temperature sensor an acceptable amount.
P1291 (M)	No Temperature Rise Seen From Intake Air Heaters	Problem detected in intake manifold air heating system.
P1292	CNG Pressure Sensor Voltage Too High	Compressed natural gas pressure sensor reading above acceptable voltage.
P1293	CNG Pressure Sensor Voltage Too Low	Compressed natural gas pressure sensor reading below acceptable voltage.
P1294 (M)	Target Idle Not Reached	Target RPM not achieved during drive idle condition. Possible vacuum leak or IAC (AIS) lost steps.
P1295 (M)	No 5 Volts to TP Sensor	Loss of a 5 volt feed to the Throttle Position Sensor has been detected.
P1295 (M)	Accelerator Position Sensor (APPS) Supply Voltage Too Low	APPS supply voltage input below the minimum acceptable voltage.
P1296	No 5 Volts to MAP Sensor	Loss of a 5 volt feed to the MAP Sensor has been detected.
P1297 (M)	No Change in MAP From Start To Run	No difference is recognized between the MAP reading at engine idle and the stored barometric pressure reading.
P1298	Lean Operation at Wide Open Throttle	A prolonged lean condition is detected during Wide Open Throttle
P1299	Vacuum Leak Found (IAC Fully Seated)	MAP Sensor signal does not correlate to Throttle Position Sensor signal. Possible vacuum leak.
P1388	Auto Shutdown Relay Control Circuit	An open or shorted condition detected in the ASD or CNG shutoff relay control ckt.
P1388	Auto Shutdown Relay Control Circuit	An open or shorted condition detected in the auto shutdown relay circuit.

DESCRIPTION AND OPERATION (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
P1389	No ASD Relay Output Voltage At PCM	No Z1 or Z2 voltage sensed when the auto shutdown relay is energized.
P1389 (M)	No ASD Relay Output Voltage at PCM	An open condition detected in the ASD relay output circuit.
P1390	Timing Belt Skipped 1 Tooth or More	Relationship between Cam and Crank signals not correct
P1391 (M)	Intermittent Loss of CMP or CKP	Loss of the Cam Position Sensor or Crank Position sensor has occurred. For PL 2.0L
P1398 (M)	Mis-Fire Adaptive Numerator at Limit	PCM is unable to learn the Crank Sensor's signal in preparation for Misfire Diagnostics. Probable defective Crank Sensor
P1399	Wait To Start Lamp Circuit	An open or shorted condition detected in the Wait to Start Lamp circuit.
P1403	No 5V to EGR Sens	Loss of 5v feed to the EGR position sensor.
P01475	Aux 5 Volt Supply Voltage High	Sensor supply voltage for ECM sensors is too high.
P1476	Too Little Secondary Air	Insufficient flow of secondary air injection detected during aspirator test (was P0411)
P1477	Too Much Secondary Air	Excessive flow of secondary air injection detected during aspirator test (was P0411).
P1478	Battery Temp Sensor Volts Out of Limit	Internal temperature sensor input voltage out of an acceptable range.
P1479	Transmission Fan Relay Circuit	An open or shorted condition detected in the transmission fan relay circuit.
P1480	PCV Solenoid Circuit	An open or shorted condition detected in the PCV solenoid circuit.
P1481	EATX RPM Pulse Perf	EATX RPM pulse generator signal for misfire detection does not correlate with expected value.
P1482	Catalyst Temperature Sensor Circuit Shorted Low	Catalyst temperature sensor circuit shorted low.
P1483	Catalyst Temperature Sensor Circuit Shorted High.	Catalyst temperature sensor circuit shorted high.
P1484	Catalytic Converter Overheat Detected	A catalyst overheat condition has been detected by the catalyst temperature sensor.
P1485	Air Injection Solenoid Circuit	An open or shorted condition detected in the air assist solenoid circuit.
P1486	Evap Leak Monitor Pinched Hose Found	LDP has detected a pinched hose in the evaporative hose system.
P1487	Hi Speed Rad Fan CTRL Relay Circuit	An open or shorted condition detected in the control circuit of the #2 high speed radiator fan control relay.
P1488	Auxiliary 5 Volt Supply Output Too Low	Auxiliary 5 volt sensor feed is sensed to be below an acceptable limit.
P1488	5 Volt Supply Voltage Low	Sensor supply voltage for ECM sensors is too low.
P1489	High Speed Fan CTRL Relay Circuit	An open or shorted condition detected in the control circuit of the high speed radiator fan control relay.
P1490	Low Speed Fan CTRL Relay Circuit	An open or shorted condition detected in control circuit of the low speed radiator fan control relay.

DESCRIPTION AND OPERATION (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
P1491	Rad Fan Control Relay Circuit	An open or shorted condition detected in the radiator fan control relay control circuit. This includes PWM solid state relays.
P1492	Ambient/Batt Temp Sen Volts Too High	External temperature sensor input above acceptable voltage.
P1492 (M)	Ambient/Batt Temp Sensor Volts Too High	Battery temperature sensor input voltage above an acceptable range.
P1493 (M)	Ambient/Batt Temp Sen Volts Too Low	External temperature sensor input below acceptable voltage.
P1493 (M)	Ambient/Batt Temp Sen Volts Too Low	Battery temperature sensor input voltage below an acceptable range.
P1494 (M)	Leak Detection Pump Sw or Mechanical Fault	Incorrect input state detected for the Leak Detection Pump (LDP) pressure switch.
P1495	Leak Detection Pump Solenoid Circuit	An open or shorted condition detected in the Leak Detection Pump (LDP) solenoid circuit.
P1496	5 Volt Supply, Output Too Low	5 volt sensor feed is sensed to be below an acceptable limit. (less than 4v for 4 sec)
P1498	High Speed Rad Fan Ground CTRL Rly Circuit	An open or shorted condition detected in the control circuit of the #3 high speed radiator fan control relay.
P1594 (G)	Charging System Voltage Too High	Battery voltage sense input above target charging voltage during engine operation.
P1594	Charging System Voltage Too High	Battery voltage sense input above target charging voltage during engine operation.
P1595	Speed Control Solenoid Circuits	An open or shorted condition detected in either of the speed control vacuum or vent solenoid control circuits.
P1595	Speed Control Solenoid Circuits	An open or shorted condition detected in the speed control vacuum or vent solenoid circuits.
P1596	Speed Control Switch Always High	Speed control switch input above maximum acceptable voltage.
P1597	Speed Control Switch Always Low	Speed control switch input below minimum acceptable voltage.
P1597	Speed Control Switch Always Low	Speed control switch input below the minimum acceptable voltage.
P1598	A/C Pressure Sensor Volts Too High	A/C pressure sensor input above maximum acceptable voltage.
P1598	A/C Sensor Input Hi	Problem detected in air conditioning electrical circuit.
P1599	A/C Pressure Sensor Volts Too Low	A/C pressure sensor input below minimum acceptable voltage.
P1599	A/C Sensor Input Lo	Problem detected in air conditioning electrical circuit.
P1680	Clutch Released Switch Circuit	Problem detected in clutch switch electrical circuit.
P1681	No I/P Cluster CCD/J1850 Messages Received	No CCD/J1850 messages received from the cluster control module.

DESCRIPTION AND OPERATION (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
P1682 (G)	Charging System Voltage Too Low	Battery voltage sense input below target charging voltage during engine operation and no significant change in voltage detected during active test of generator output circuit.
P1682	Charging System Voltage Too Low	Charging system output voltage low.
P1683	SPD CTRL PWR Relay; or S/C 12v Driver CKT	An open or shorted condition detected in the speed control servo power control circuit.
P1683	Spd ctrl pwr rly, or s/c 12v driver circuit	An open or shorted condition detected in the speed control servo power control circuit.
P1684	Batt Loss in 50 Star	The battery has been disconnected within the last 50 starts
P1685	SKIM Invalid Key	The engine controller has received an invalid key from the SKIM.
P1686	No SKIM BUS Messages Received	No CCD/J1850 messages received from the Smart Key Immobilizer Module (SKIM).
P1687	No MIC BUS Message	No CCD/J1850 messages received from the Mechanical Instrument Cluster (MIC) module.
P1688 (M)	Internal Fuel Injection Pump Controller Failure	Internal problem within the fuel injection pump. Low power, engine derated, or engine stops.
P1689 (M)	No Communication Between ECM and Injection Pump Module	Data link circuit failure between ECM and fuel injection pump. Low power, engine derated, or engine stops.
P1690 (M)	Fuel Injection Pump CKP Sensor Does Not Agree With ECM CKP Sensor	Problem in fuel sync signal. Possible injection pump timing problem. Low power, engine derated, or engine stops.
P1691	Fuel Injection Pump Controller Calibration Error	Internal fuel injection pump failure. Low power, engine derated, or engine stops.
P1692	DTC Set In ECM	A "Companion DTC" was set in both the ECM and PCM.
P1693 (M)	DTC Detected in Companion Module	A fault has been generated in the companion engine control module.
P1693 (M)	DTC Detected in PCM/ECM or DTC Detected in ECM	A "Companion DTC" was set in both the ECM and PCM.
P1694	Fault In Companion Module	No CCD/J1850 messages received from the powertrain control module-Aisin transmission
P1694 (M)	No CCD Messages received from ECM	Bus communication failure to PCM.
P1695	No CCD/J1850 Message From Body Control Module	No CCD/J1850 messages received from the body control module.
P1696	PCM Failure EEPROM Write Denied	Unsuccessful attempt to write to an EEPROM location by the control module.
P1697	PCM Failure SRI Mile Not Stored	Unsuccessful attempt to update Service Reminder Indicator (SRI or EMR) mileage in the control module EEPROM.
P1698	No CCD/J1850 Message From TCM	No CCD/J1850 messages received from the electronic transmission control module (EATX) or the Aisin transmission controller.

DESCRIPTION AND OPERATION (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
P1698	No CCD Messages received from PCM	Bus communication failure to PCM. A "Companion DTC" was set in both the ECM and PCM.
P1719	Skip Shift Solenoid Circuit	An open or shorted condition detected in the transmission 2-3 gear lock-out solenoid control circuit.
P1740	TCC or OD Sol Perf	A rationality error has been detected in either the TCC solenoid or overdrive solenoid systems.
P1740 (M)	TCC OR O/D Solenoid Performance	Problem detected in transmission convertor clutch and/or overdrive circuits (diesel engine with 4-speed auto. trans. only).
P1756 (M)	GOV Press Not Equal to Target @ 15-20 PSI	The requested pressure and the actual pressure are not within a tolerance band for the Governor Control System which is used to regulate governor pressure to control shifts for 1st, 2nd, and 3rd gear. (Mid Pressure Malfunction)
P1756 (M)	Governor Pressure Not Equal to Target @ 15-20 PSI	Governor sensor input not between 10 and 25 psi when requested (4-speed auto. trans. only).
P1757	GOV Press Not Equal to Target @ 15-20 PSI	The requested pressure and the actual pressure are not within a tolerance band for the Governor Control System which is used to regulate governor pressure to control shifts for 1st, 2nd, and 3rd gear (Zero Pressure Malfunction)
P1757 (M)	Governor Pressure Above 3 PSI In Gear With 0 MPH	Governor pressure greater than 3 psi when requested to be 0 psi (4-speed auto. trans. only).
P1762 (M)	Gov Press Sen Offset Volts Too Low or High	The Governor Pressure Sensor input is greater than a calibration limit or is less than a calibration limit for 3 consecutive park/neutral calibrations.
P1762 (M)	Governor Press Sen Offset Volts Too Low or High	Sensor input greater or less than calibration for 3 consecutive Neutral/Park occurrences (4-speed auto. trans. only).
P1763	Governor Pressure Sensor Volts Too Hi	The Governor Pressure Sensor input is above an acceptable voltage level.
P1763 (M)	Governor Pressure Sensor Volts Too HI	Voltage greater than 4.89 volts (4-speed auto. trans. only).
P1764 (M)	Governor Pressure Sensor Volts Too Low	The Governor Pressure Sensor input is below an acceptable voltage level.
P1764 (M)	Governor Pressure Sensor Volts Too Low	Voltage less than .10 volts (4-speed auto. trans. only).
P1765 (M)	Trans 12 Volt Supply Relay CTRL Circuit	An open or shorted condition is detected in the Transmission Relay control circuit. This relay supplies power to the TCC
P1765 (M)	Trans 12 Volt Supply Relay Ctrl Circuit	Current state of solenoid output port is different than expected (4-speed auto. trans. only).
P1899 (M)	P/N Switch Stuck in Park or in Gear	Incorrect input state detected for the Park/Neutral switch.
P1899 (M)	P/N Switch Stuck in Park or in Gear	Incorrect input state detected for the Park/Neutral switch (3 or 4-speed auto. trans. only).

DESCRIPTION AND OPERATION (Continued)

TASK MANAGER

DESCRIPTION

The PCM is responsible for efficiently coordinating the operation of all the emissions-related components. The PCM is also responsible for determining if the diagnostic systems are operating properly. The software designed to carry out these responsibilities is called the 'Task Manager'.

OPERATION

The Task Manager determines which tests happen when and which functions occur when. Many of the diagnostic steps required by OBD II must be performed under specific operating conditions. The Task Manager software organizes and prioritizes the diagnostic procedures. The job of the Task Manager is to determine if conditions are appropriate for tests to be run, monitor the parameters for a trip for each test, and record the results of the test. Following are the responsibilities of the Task Manager software:

- Test Sequence
- MIL Illumination
- Diagnostic Trouble Codes (DTCs)
- Trip Indicator
- Freeze Frame Data Storage
- Similar Conditions Window

Test Sequence

In many instances, emissions systems must fail diagnostic tests more than once before the PCM illuminates the MIL. These tests are known as 'two trip monitors.' Other tests that turn the MIL lamp on after a single failure are known as 'one trip monitors.' A trip is defined as 'start the vehicle and operate it to meet the criteria necessary to run the given monitor.'

Many of the diagnostic tests must be performed under certain operating conditions. However, there are times when tests cannot be run because another test is in progress (conflict), another test has failed (pending) or the Task Manager has set a fault that may cause a failure of the test (suspend).

- Pending

Under some situations the Task Manager will not run a monitor if the MIL is illuminated and a fault is stored from another monitor. In these situations, the Task Manager postpones monitors **pending** resolution of the original fault. The Task Manager does not run the test until the problem is remedied.

For example, when the MIL is illuminated for an Oxygen Sensor fault, the Task Manager does not run the Catalyst Monitor until the Oxygen Sensor fault is remedied. Since the Catalyst Monitor is based on signals from the Oxygen Sensor, running the test would produce inaccurate results.

- Conflict

There are situations when the Task Manager does not run a test if another monitor is in progress. In these situations, the effects of another monitor running could result in an erroneous failure. If this **conflict** is present, the monitor is not run until the conflicting condition passes. Most likely the monitor will run later after the conflicting monitor has passed.

For example, if the Fuel System Monitor is in progress, the Task Manager does not run the EGR Monitor. Since both tests monitor changes in air/fuel ratio and adaptive fuel compensation, the monitors will conflict with each other.

- Suspend

Occasionally the Task Manager may not allow a two trip fault to mature. The Task Manager will **suspend** the maturing of a fault if a condition exists that may induce an erroneous failure. This prevents illuminating the MIL for the wrong fault and allows more precise diagnosis.

For example, if the PCM is storing a one trip fault for the Oxygen Sensor and the EGR monitor, the Task Manager may still run the EGR Monitor but will suspend the results until the Oxygen Sensor Monitor either passes or fails. At that point the Task Manager can determine if the EGR system is actually failing or if an Oxygen Sensor is failing.

MIL Illumination

The PCM Task Manager carries out the illumination of the MIL. The Task Manager triggers MIL illumination upon test failure, depending on monitor failure criteria.

The Task Manager Screen shows both a Requested MIL state and an Actual MIL state. When the MIL is illuminated upon completion of a test for a third trip, the Requested MIL state changes to OFF. However, the MIL remains illuminated until the next key cycle. (On some vehicles, the MIL will actually turn OFF during the third key cycle) During the key cycle for the third good trip, the Requested MIL state is OFF, while the Actual MIL state is ON. After the next key cycle, the MIL is not illuminated and both MIL states read OFF.

Diagnostic Trouble Codes (DTCs)

With OBD II, different DTC faults have different priorities according to regulations. As a result, the priorities determine MIL illumination and DTC erasure. DTCs are entered according to individual priority. DTCs with a higher priority overwrite lower priority DTCs.

Priorities

- Priority 0 —Non-emissions related trouble codes

DESCRIPTION AND OPERATION (Continued)

- Priority 1 — One trip failure of a two trip fault for non-fuel system and non-misfire.
- Priority 2 — One trip failure of a two trip fault for fuel system (rich/lean) or misfire.
- Priority 3 — Two trip failure for a non-fuel system and non-misfire or matured one trip comprehensive component fault.
- Priority 4 — Two trip failure or matured fault for fuel system (rich/lean) and misfire or one trip catalyst damaging misfire.

Non-emissions related failures have no priority. One trip failures of two trip faults have low priority. Two trip failures or matured faults have higher priority. One and two trip failures of fuel system and misfire monitor take precedence over non-fuel system and non-misfire failures.

DTC Self Erasure

With one trip components or systems, the MIL is illuminated upon test failure and DTCs are stored.

Two trip monitors are components requiring failure in two consecutive trips for MIL illumination. Upon failure of the first test, the Task Manager enters a maturing code. If the component fails the test for a second time the code matures and a DTC is set.

After three good trips the MIL is extinguished and the Task Manager automatically switches the trip counter to a warm-up cycle counter. DTCs are automatically erased following 40 warm-up cycles if the component does not fail again.

For misfire and fuel system monitors, the component must pass the test under a Similar Conditions Window in order to record a good trip. A Similar Conditions Window is when engine RPM is within ± 375 RPM and load is within $\pm 10\%$ of when the fault occurred.

NOTE: It is important to understand that a component does not have to fail under a similar window of operation to mature. It must pass the test under a Similar Conditions Window when it failed to record a Good Trip for DTC erasure for misfire and fuel system monitors.

DTCs can be erased anytime with a DRB III. Erasing the DTC with the DRB III erases all OBD II information. The DRB III automatically displays a warning that erasing the DTC will also erase all OBD II monitor data. This includes all counter information for warm-up cycles, trips and Freeze Frame.

Trip Indicator

The **Trip** is essential for running monitors and extinguishing the MIL. In OBD II terms, a trip is a set of vehicle operating conditions that must be met for a specific monitor to run. All trips begin with a key cycle.

Good Trip

The Good Trip counters are as follows:

- Specific Good Trip
- Fuel System Good Trip
- Misfire Good Trip
- Alternate Good Trip (appears as a Global Good Trip on DRB III)
- Comprehensive Components
- Major Monitor
- Warm-Up Cycles

Specific Good Trip

The term Good Trip has different meanings depending on the circumstances:

- If the MIL is OFF, a trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.
- If the MIL is ON and a DTC was set by the Fuel Monitor or Misfire Monitor (both continuous monitors), the vehicle must be operated in the Similar Condition Window for a specified amount of time.
- If the MIL is ON and a DTC was set by a Task Manager commanded once-per-trip monitor (such as the Oxygen Sensor Monitor, Catalyst Monitor, Purge Flow Monitor, Leak Detection Pump Monitor, EGR Monitor or Oxygen Sensor Heater Monitor), a good trip is when the monitor is passed on the next start-up.
- If the MIL is ON and any other emissions DTC was set (not an OBD II monitor), a good trip occurs when the Oxygen Sensor Monitor and Catalyst Monitor have been completed, or two minutes of engine run time if the Oxygen Sensor Monitor and Catalyst Monitor have been stopped from running.

Fuel System Good Trip

To count a good trip (three required) and turn off the MIL, the following conditions must occur:

- Engine in closed loop
 - Operating in Similar Conditions Window
 - Short Term multiplied by Long Term less than threshold
 - Less than threshold for a predetermined time
- If all of the previous criteria are met, the PCM will count a good trip (three required) and turn off the MIL.

Misfire Good Trip

If the following conditions are met the PCM will count one good trip (three required) in order to turn off the MIL:

- Operating in Similar Condition Window
- 1000 engine revolutions with no misfire

Warm-Up Cycles

Once the MIL has been extinguished by the Good Trip Counter, the PCM automatically switches to a Warm-Up Cycle Counter that can be viewed on the DRB III. Warm-Up Cycles are used to erase DTCs and Freeze Frames. Forty Warm-Up cycles must

DESCRIPTION AND OPERATION (Continued)

occur in order for the PCM to self-erase a DTC and Freeze Frame. A Warm-Up Cycle is defined as follows:

- Engine coolant temperature must start below and rise above 160° F
- Engine coolant temperature must rise by 40° F
- No further faults occur

Freeze Frame Data Storage

Once a failure occurs, the Task Manager records several engine operating conditions and stores it in a Freeze Frame. The Freeze Frame is considered one frame of information taken by an on-board data recorder. When a fault occurs, the PCM stores the input data from various sensors so that technicians can determine under what vehicle operating conditions the failure occurred.

The data stored in Freeze Frame is usually recorded when a system fails the first time for two trip faults. Freeze Frame data will only be overwritten by a different fault with a higher priority.

CAUTION: Erasing DTCs, either with the DRB III or by disconnecting the battery, also clears all Freeze Frame data.

Similar Conditions Window

The Similar Conditions Window displays information about engine operation during a monitor. Absolute MAP (engine load) and Engine RPM are stored in this window when a failure occurs. There are two different Similar conditions Windows: Fuel System and Misfire.

FUEL SYSTEM

- **Fuel System Similar Conditions Window** — An indicator that 'Absolute MAP When Fuel Sys Fail' and 'RPM When Fuel Sys Failed' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.

- **Absolute MAP When Fuel Sys Fail** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.

- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.

- **RPM When Fuel Sys Fail** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.

- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.

- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.

- **Upstream O₂S Volts** — A live reading of the Oxygen Sensor to indicate its performance. For example, stuck lean, stuck rich, etc.

- **SCW Time in Window (Similar Conditions Window Time in Window)** — A timer used by the PCM that indicates that, after all Similar Conditions have been met, if there has been enough good engine running time in the SCW without failure detected. This timer is used to increment a Good Trip.

- **Fuel System Good Trip Counter** — A Trip Counter used to turn OFF the MIL for Fuel System DTCs. To increment a Fuel System Good Trip, the engine must be in the Similar Conditions Window, Adaptive Memory Factor must be less than calibrated threshold and the Adaptive Memory Factor must stay below that threshold for a calibrated amount of time.

- **Test Done This Trip** — Indicates that the monitor has already been run and completed during the current trip.

MISFIRE

- **Same Misfire Warm-Up State** — Indicates if the misfire occurred when the engine was warmed up (above 160° F).

- **In Similar Misfire Window** — An indicator that 'Absolute MAP When Misfire Occurred' and 'RPM When Misfire Occurred' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.

- **Absolute MAP When Misfire Occurred** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.

- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.

- **RPM When Misfire Occurred** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.

- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.

- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.

- **200 Rev Counter** — Counts 0–100 720 degree cycles.

- **SCW Cat 200 Rev Counter** — Counts when in similar conditions.

- **SCW FTP 1000 Rev Counter** — Counts 0–4 when in similar conditions.

- **Misfire Good Trip Counter** — Counts up to three to turn OFF the MIL.

- **Misfire Data** — Data collected during test.

DESCRIPTION AND OPERATION (Continued)

- **Test Done This Trip** — Indicates YES when the test is done.

MONITORED SYSTEMS

OPERATION

There are new electronic circuit monitors that check fuel, emission, engine and ignition performance. These monitors use information from various sensor circuits to indicate the overall operation of the fuel, engine, ignition and emission systems and thus the emissions performance of the vehicle.

The fuel, engine, ignition and emission systems monitors do not indicate a specific component problem. They do indicate that there is an implied problem within one of the systems and that a specific problem must be diagnosed.

If any of these monitors detect a problem affecting vehicle emissions, the Malfunction Indicator Lamp (MIL) will be illuminated. These monitors generate Diagnostic Trouble Codes that can be displayed with the MIL or a scan tool.

The following is a list of the system monitors:

- Misfire Monitor
- Fuel System Monitor
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor
- Leak Detection Pump Monitor (if equipped)

All these system monitors require two consecutive trips with the malfunction present to set a fault.

Refer to the appropriate Powertrain Diagnostics Procedures manual for diagnostic procedures.

The following is an operation and description of each system monitor :

OXYGEN SENSOR (O2S) MONITOR

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the Catalyst and Fuel Monitors.

The O2S can fail in any or all of the following manners:

- slow response rate

- reduced output voltage
- dynamic shift
- shorted or open circuits

Response rate is the time required for the sensor to switch from lean to rich once it is exposed to a richer than optimum A/F mixture or vice versa. As the sensor starts malfunctioning, it could take longer to detect the changes in the oxygen content of the exhaust gas.

The output voltage of the O2S ranges from 0 to 1 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value.

OXYGEN SENSOR HEATER MONITOR

If there is an oxygen sensor (O2S) shorted to voltage DTC, as well as a O2S heater DTC, the O2S fault **MUST** be repaired first. Before checking the O2S fault, verify that the heater circuit is operating correctly.

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The voltage readings taken from the O2S sensor are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O2S sensor is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S sensor must be tested to ensure that it is heating the sensor properly.

The O2S sensor circuit is monitored for a drop in voltage. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S sensor output voltage from the other effects.

LEAK DETECTION PUMP MONITOR (IF EQUIPPED)

The leak detection assembly incorporates two primary functions: it must detect a leak in the evaporative system and seal the evaporative system so the leak detection test can be run.

The primary components within the assembly are: A three port solenoid that activates both of the func-

DESCRIPTION AND OPERATION (Continued)

tions listed above; a pump which contains a switch, two check valves and a spring/diaphragm, a canister vent valve (CVV) seal which contains a spring loaded vent seal valve.

Immediately after a cold start, between predetermined temperature thresholds limits, the three port solenoid is briefly energized. This initializes the pump by drawing air into the pump cavity and also closes the vent seal. During non test conditions the vent seal is held open by the pump diaphragm assembly which pushes it open at the full travel position. The vent seal will remain closed while the pump is cycling due to the reed switch triggering of the three port solenoid that prevents the diaphragm assembly from reaching full travel. After the brief initialization period, the solenoid is de-energized allowing atmospheric pressure to enter the pump cavity, thus permitting the spring to drive the diaphragm which forces air out of the pump cavity and into the vent system. When the solenoid is energized and de energized, the cycle is repeated creating flow in typical diaphragm pump fashion. The pump is controlled in 2 modes:

Pump Mode: The pump is cycled at a fixed rate to achieve a rapid pressure build in order to shorten the overall test length.

Test Mode: The solenoid is energized with a fixed duration pulse. Subsequent fixed pulses occur when the diaphragm reaches the Switch closure point.

The spring in the pump is set so that the system will achieve an equalized pressure of about 7.5" H₂O. The cycle rate of pump strokes is quite rapid as the system begins to pump up to this pressure. As the pressure increases, the cycle rate starts to drop off. If there is no leak in the system, the pump would eventually stop pumping at the equalized pressure. If there is a leak, it will continue to pump at a rate representative of the flow characteristic of the size of the leak. From this information we can determine if the leak is larger than the required detection limit (currently set at .040" orifice by CARB). If a leak is revealed during the leak test portion of the test, the test is terminated at the end of the test mode and no further system checks will be performed.

After passing the leak detection phase of the test, system pressure is maintained by turning on the LDP's solenoid until the purge system is activated. Purge activation in effect creates a leak. The cycle rate is again interrogated and when it increases due to the flow through the purge system, the leak check portion of the diagnostic is complete.

The canister vent valve will unseal the system after completion of the test sequence as the pump diaphragm assembly moves to the full travel position.

Evaporative system functionality will be verified by using the stricter evap purge flow monitor. At an

appropriate warm idle the LDP will be energized to seal the canister vent. The purge flow will be clocked up from some small value in an attempt to see a shift in the O₂ control system. If fuel vapor, indicated by a shift in the O₂ control, is present the test is passed. If not, it is assumed that the purge system is not functioning in some respect. The LDP is again turned off and the test is ended.

MISFIRE MONITOR

Excessive engine misfire results in increased catalyst temperature and causes an increase in HC emissions. Severe misfires could cause catalyst damage. To prevent catalytic converter damage, the PCM monitors engine misfire.

The Powertrain Control Module (PCM) monitors for misfire during most engine operating conditions (positive torque) by looking at changes in the crankshaft speed. If a misfire occurs the speed of the crankshaft will vary more than normal.

FUEL SYSTEM MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide. The catalyst works best when the Air Fuel (A/F) ratio is at or near the optimum of 14.7 to 1.

The PCM is programmed to maintain the optimum air/fuel ratio of 14.7 to 1. This is done by making short term corrections in the fuel injector pulse width based on the O₂S sensor output. The programmed memory acts as a self calibration tool that the engine controller uses to compensate for variations in engine specifications, sensor tolerances and engine fatigue over the life span of the engine. By monitoring the actual fuel-air ratio with the O₂S sensor (short term) and multiplying that with the program long-term (adaptive) memory and comparing that to the limit, it can be determined whether it will pass an emissions test. If a malfunction occurs such that the PCM cannot maintain the optimum A/F ratio, then the MIL will be illuminated.

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O₂S's) to monitor the efficiency of the converter. The dual O₂S's sensor strategy is based on the fact that

DESCRIPTION AND OPERATION (Continued)

as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O₂S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O₂S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O₂S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O₂S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O₂S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O₂S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O₂S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O₂S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL will be illuminated.

TRIP DEFINITION

OPERATION

The term "Trip" has different meanings depending on what the circumstances are. If the MIL (Malfunction Indicator Lamp) is OFF, a Trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.

When any Emission DTC is set, the MIL on the dash is turned ON. When the MIL is ON, it takes 3 good trips to turn the MIL OFF. In this case, it depends on what type of DTC is set to know what a "Trip" is.

For the Fuel Monitor or Mis-Fire Monitor (continuous monitor), the vehicle must be operated in the

"Similar Condition Window" for a specified amount of time to be considered a Good Trip.

If a Non-Continuous OBDII Monitor, such as:

- Oxygen Sensor
- Catalyst Monitor
- Purge Flow Monitor
- Leak Detection Pump Monitor (if equipped)
- EGR Monitor (if equipped)
- Oxygen Sensor Heater Monitor

fails twice in a row and turns ON the MIL, re-running that monitor which previously failed, on the next start-up and passing the monitor is considered to be a Good Trip.

If any other Emission DTC is set (not an OBDII Monitor), a Good Trip is considered to be when the Oxygen Sensor Monitor and Catalyst Monitor have been completed; or 2 Minutes of engine run time if the Oxygen Sensor Monitor or Catalyst Monitor have been stopped from running.

It can take up to 2 Failures in a row to turn on the MIL. After the MIL is ON, it takes 3 Good Trips to turn the MIL OFF. After the MIL is OFF, the PCM will self-erase the DTC after 40 Warm-up cycles. A Warm-up cycle is counted when the ECT (Engine Coolant Temperature Sensor) has crossed 160°F and has risen by at least 40°F since the engine has been started.

COMPONENT MONITORS

OPERATION

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (MIL) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks. Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is high and engine rpm is 1600 or greater and the TPS indicates a large throttle opening, a DTC will be set. The same applies to low vacuum if the TPS indicates a small throttle opening.

All open/short circuit checks or any component that has an associated limp in will set a fault after 1 trip with the malfunction present. Components without an associated limp in will take two trips to illuminate the MIL.

DESCRIPTION AND OPERATION (Continued)

Refer to the Diagnostic Trouble Codes Description Charts in this section and the appropriate Powertrain Diagnostic Procedure Manual for diagnostic procedures.

NON-MONITORED CIRCUITS

The PCM does not monitor the following circuits, systems and conditions that could have malfunctions causing driveability problems. The PCM might not store diagnostic trouble codes for these conditions. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. For example, a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code.

OPERATION**FUEL PRESSURE**

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor or fuel system diagnostic trouble code.

SECONDARY IGNITION CIRCUIT

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables.

CYLINDER COMPRESSION

The PCM cannot detect uneven, low, or high engine cylinder compression.

EXHAUST SYSTEM

The PCM cannot detect a plugged, restricted or leaking exhaust system, although it may set a fuel system fault.

FUEL INJECTOR MECHANICAL MALFUNCTIONS

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

EXCESSIVE OIL CONSUMPTION

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

THROTTLE BODY AIR FLOW

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

VACUUM ASSIST

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

PCM SYSTEM GROUND

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, also during diagnostic.

PCM CONNECTOR ENGAGEMENT

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

HIGH AND LOW LIMITS**OPERATION**

The PCM compares input signal voltages from each input device with established high and low limits for the device. If the input voltage is not within limits and other criteria are met, the PCM stores a diagnostic trouble code in memory. Other diagnostic trouble code criteria might include engine RPM limits or input voltages from other sensors or switches that must be present before verifying a diagnostic trouble code condition.

LOAD VALUE**OPERATION**

ENGINE	IDLE/NEUTRAL	2500 RPM/ NEUTRAL
All Engines	2% to 8% of Maximum Load	9% to 17% of Maximum Load

DESCRIPTION AND OPERATION

EVAPORATION CONTROL SYSTEM

OPERATION

The evaporation control system prevents the emission of fuel tank vapors into the atmosphere. When fuel evaporates in the fuel tank, the vapors pass through vent hoses or tubes to a charcoal filled evaporative canister. The canister temporarily holds the vapors. The Powertrain Control Module (PCM) allows intake manifold vacuum to draw vapors into the combustion chambers during certain operating conditions.

All engines use a duty cycle purge system. The PCM controls vapor flow by operating the duty cycle EVAP purge solenoid. Refer to Duty Cycle EVAP Canister Purge Solenoid.

When equipped with certain emissions packages, a Leak Detection Pump (LDP) will be used as part of the evaporative system for OBD II requirements. Also refer to Leak Detection Pump.

NOTE: The evaporative system uses specially manufactured lines/hoses. If replacement becomes necessary, only use fuel resistant hose.

ROLLOVER VALVE

DESCRIPTION

The fuel tank is equipped with a rollover valve. The valve is located on the top of the fuel tank (Fig. 1).

Fig. 1 Rollover Valve Location

- 1 - ROLLOVER VALVE
- 2 - RETAINER CLAMP
- 3 - LOCKNUT
- 4 - FUEL PUMP MODULE
- 5 - FUEL FILTER/FUEL PRESSURE REGULATOR
- 6 - ALIGNMENT ARROW
- 7 - PIGTAIL HARNESS
- 8 - FUEL SUPPLY TUBE
- 9 - EVAP CANISTER VENT LINE

OPERATION

The rollover valve will prevent fuel flow through the fuel tank vent (EVAP) hoses in the event of an accidental vehicle rollover. The EVAP canister draws fuel vapors from the fuel tank through this valve.

DESCRIPTION AND OPERATION (Continued)

The valve cannot be serviced separately. If replacement is necessary, the fuel tank must be replaced.

EVAP CANISTER

DESCRIPTION

A maintenance free, EVAP canister is used on all vehicles. The EVAP canister is located under the left side of vehicle near the front of the rear axle (Fig. 2).

Fig. 2 EVAP Canister Location

- 1 - CANISTER MOUNTING BRACKET
- 2 - BRACKET NUTS (3)
- 3 - EVAP CANISTER
- 4 - CANISTER MOUNTING NUTS (2)
- 5 - L. R. SHOCK ABSORBER
- 6 - EVAP LINES/HOSES
- 7 - DOWEL PINS AND BUSHINGS (2)

OPERATION

The EVAP canister is filled with granules of an activated carbon mixture. Fuel vapors entering the EVAP canister are absorbed by the charcoal granules.

Fuel tank pressure vents into the EVAP canister. Fuel vapors are temporarily held in the canister until they can be drawn into the intake manifold. The duty cycle EVAP canister purge solenoid allows the EVAP canister to be purged at predetermined times and at certain engine operating conditions.

DUTY CYCLE EVAP CANISTER PURGE SOLENOID

OPERATION

The duty cycle EVAP canister purge solenoid (DCP) regulates the rate of vapor flow from the EVAP canister to the intake manifold. The Powertrain Control Module (PCM) operates the solenoid.

During the cold start warm-up period and the hot start time delay, the PCM does not energize the solenoid. When de-energized, no vapors are purged. The PCM de-energizes the solenoid during open loop operation.

The engine enters closed loop operation after it reaches a specified temperature and the time delay ends. During closed loop operation, the PCM cycles (energizes and de-energizes) the solenoid 5 or 10 times per second, depending upon operating conditions. The PCM varies the vapor flow rate by changing solenoid pulse width. Pulse width is the amount of time that the solenoid is energized. The PCM adjusts solenoid pulse width based on engine operating condition.

LEAK DETECTION PUMP (LDP)

OPERATION

The Leak Detection Pump (LDP) is used only with certain emission packages.

The LDP is a device used to detect a leak in the evaporative system.

The pump contains a 3 port solenoid, a pump that contains a switch, a spring loaded canister vent valve seal, 2 check valves and a spring/diaphragm.

Immediately after a cold start, engine temperature between 40°F and 86°F, the 3 port solenoid is briefly energized. This initializes the pump by drawing air into the pump cavity and also closes the vent seal. During non-test test conditions, the vent seal is held open by the pump diaphragm assembly which pushes it open at the full travel position. The vent seal will remain closed while the pump is cycling. This is due to the operation of the 3 port solenoid which prevents the diaphragm assembly from reaching full travel. After the brief initialization period, the solenoid is de-energized, allowing atmospheric pressure to enter the pump cavity. This permits the spring to drive the diaphragm which forces air out of the pump cavity and into the vent system. When the solenoid is energized and de-energized, the cycle is repeated creating flow in typical diaphragm pump fashion. The pump is controlled in 2 modes:

PUMP MODE: The pump is cycled at a fixed rate to achieve a rapid pressure build in order to shorten the overall test time.

TEST MODE: The solenoid is energized with a fixed duration pulse. Subsequent fixed pulses occur when the diaphragm reaches the switch closure point.

The spring in the pump is set so that the system will achieve an equalized pressure of about 7.5 inches of water.

When the pump starts, the cycle rate is quite high. As the system becomes pressurized pump rate drops.

DESCRIPTION AND OPERATION (Continued)

| 4 – REMOTE FILTER | 10 – DCPS |
| 5 – COMBINED CANISTER VENT VALVE & LEAK DETECTION PUMP | 11 – SWITCH SIGNAL INPUT TO THE PCM |
| 6 – CANISTER | 12 – ENGINE VACUUM LINE |

If there is no leak the pump will quit. If there is a leak, the test is terminated at the end of the test mode.

If there is no leak, the purge monitor is run. If the cycle rate increases due to the flow through the purge system, the test is passed and the diagnostic is complete.

The canister vent valve will unseal the system after completion of the test sequence as the pump diaphragm assembly moves to the full travel position.

A typical system schematic is shown in (Fig. 3).

CRANKCASE VENTILATION SYSTEM

DESCRIPTION

All 2.5L 4-cylinder and 4.0L 6-cylinder engines are equipped with a Closed Crankcase Ventilation (CCV) system (Fig. 4) or (Fig. 5).

OPERATION

The CCV system performs the same function as a conventional PCV system, but does not use a vacuum controlled valve.

On 4.0L 6 cylinder engines, a molded vacuum tube connects manifold vacuum to top of cylinder head (valve) cover at dash panel end. The vacuum fitting contains a fixed orifice of a calibrated size. It meters the amount of crankcase vapors drawn out of the engine.

On 2.5L 4 cylinder engines, a fitting on drivers side of cylinder head (valve) cover contains the metered orifice. It is connected to manifold vacuum.

A fresh air supply hose from the air cleaner is connected to front of cylinder head cover on 4.0L engines. It is connected to rear of cover on 2.5L engines.

DESCRIPTION AND OPERATION (Continued)

8056d9f4

Fig. 4 CCV System—2.5L Engine—Typical

8056d9f5

Fig. 5 CCV System—4.0L Engine—Typical

- 1 - AIR INLET FITTING
- 2 - FIXED ORIFICE FITTING
- 3 - AIR FILTER COVER

When the engine is operating, fresh air enters the engine and mixes with crankcase vapors. Manifold vacuum draws the vapor/air mixture through the

fixed orifice and into the intake manifold. The vapors are then consumed during combustion.

VEHICLE EMISSION CONTROL INFORMATION (VECI) LABEL

DESCRIPTION

All vehicles are equipped with a combined VECI label. This label is located in the engine compartment (Fig. 6).

J9325-27

Fig. 6 VECI Label Location—Typical

- 1 - VECI LABEL

OPERATION

The VECI label contains the following:

- Engine family and displacement
- Evaporative family
- Emission control system schematic
- Certification application
- Engine timing specifications (if adjustable)
- Idle speeds (if adjustable)
- Spark plug and gap

The label also contains an engine vacuum schematic. There are unique labels for vehicles built for sale in the state of California and the country of Canada. Canadian labels are written in both the English and French languages. These labels are permanently attached and cannot be removed without defacing information and destroying label.

DIAGNOSIS AND TESTING

VACUUM SCHEMATICS

A vacuum schematic for emission related items can be found on the Vehicle Emission Control Information (VECI) label. For label location, refer to Vehicle Emission Control Information (VECI) Label.

DIAGNOSIS AND TESTING (Continued)

LEAK DETECTION PUMP (LDP)

Refer to the appropriate Powertrain Diagnostic Procedures service manual for LDP testing procedures.

CRANKCASE VENTILATION SYSTEM

TESTING/CLEANING

The Crankcase Ventilation (CCV) system performs the same function as a conventional PCV system, but does not use a vacuum controlled valve. A vacuum fitting containing a fixed orifice of a calibrated size is used. It meters the amount of crankcase vapors drawn out of the engine.

- (1) Check each CCV system tube (line) for leaks, cracks, kinks or bends. Replace as necessary
- (2) Disconnect each CCV tube..
- (3) Blow compressed air through each tube and check for blockage or restrictions. If cleaning is necessary, spray a soapy-type all-purpose cleaner into each component and blow out. After restriction is cleared, rinse out component with clear water. Blow water from component and install to vehicle. **To prevent damage to plastic components, never spray carburetor-type cleaner into any of the plastic tubes or the fixed orifice fitting. Never attempt to clean the fixed orifice fitting with a metal object as calibration could be affected. If fixed fitting cannot be cleared, replace it.**

REMOVAL AND INSTALLATION

EVAP CANISTER

The EVAP canister is located under left side of vehicle near front of rear axle (Fig. 7).

REMOVAL

- (1) Disconnect vacuum hoses/lines at EVAP canister. Note location of lines before removal.
- (2) Remove EVAP canister and mounting bracket assembly from body (3 nuts).
- (3) Remove canister from mounting bracket (2 nuts).

INSTALLATION

- (1) Position canister into canister mounting bracket. Align 2 canister dowel pins into rubber bushings.
- (2) Install 2 canister nuts and tighten to 5 N·m (45 in. lbs.) torque.
- (3) Position canister and bracket assembly to body.
- (4) Install 3 nuts and tighten to 43 N·m (32 ft. lbs.) torque.
- (5) Connect vacuum hoses/lines at EVAP canister.

Fig. 7 EVAP Canister Location

- 2 - BRACKET NUTS (3)
- 3 - EVAP CANISTER
- 4 - CANISTER MOUNTING NUTS (2)
- 5 - L. R. SHOCK ABSORBER
- 6 - EVAP LINES/HOSES
- 7 - DOWEL PINS AND BUSHINGS (2)

DUTY CYCLE EVAP CANISTER PURGE SOLENOID

REMOVAL

The solenoid attaches to a bracket located in right-rear side of engine compartment (Fig. 8) or (Fig. 9). The top of the solenoid has the word UP or TOP on it. The solenoid will not operate properly unless it is installed correctly.

- (1) Disconnect electrical wiring connector at solenoid.
- (2) Disconnect vacuum harness at solenoid.
- (3) Remove solenoid and its support bracket.

INSTALLATION

- (1) Install EVAP canister purge solenoid and its mounting bracket to cowl panel.
- (2) Tighten bolt to 5 N·m (45 in. lbs.) torque.
- (3) Connect vacuum harness and wiring connector.

ROLLOVER VALVE(S)

The rollover valves(s) are/is molded into the fuel tank and are not serviced separately. If replacement is necessary, the fuel tank must be replaced. Refer to Fuel Tank Removal/Installation.

REMOVAL AND INSTALLATION (Continued)

LEAK DETECTION PUMP (LDP)

The LDP is located in the right-rear side of engine compartment (Fig. 9). The LDP filter is located above the LDP (Fig. 9). The LDP and LDP filter are replaced (serviced) as one unit.

REMOVAL

- (1) Carefully remove hose at LDP filter.
- (2) Remove LDP filter mounting bolt and remove from vehicle.
- (3) Carefully remove vapor/vacuum lines at LDP.
- (4) Disconnect electrical connector at LDP.
- (5) Remove 2 LDP mounting screws (Fig. 9) and remove from vehicle.

INSTALLATION

- (1) Install LDP to mounting bracket. Tighten screws to 1 N·m (11 in. lbs.) torque.
- (2) Install LDP filter to mounting bracket. Tighten bolt to 7 N·m (65 in. lbs.) torque.
- (3) Carefully install vapor/vacuum lines to LDP, and install hose to LDP filter. **The vapor/vacuum lines and hoses must be firmly connected. Check the vapor/vacuum lines at the LDP, LDP filter and EVAP canister purge solenoid for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**
- (4) Connect electrical connector to LDP.

SPECIFICATIONS**TORQUE CHART**

Description	Torque

DESCRIPTION AND OPERATION

EMISSION CONTROL SYSTEM—2.5L DIESEL ENGINE

DESCRIPTION

The 2.5L diesel Engine Control Module (ECM) and Powertrain Control Module (PCM) monitor and control many different circuits in the fuel injection pump and engine systems. If the ECM senses a problem with a monitored circuit that indicates an actual problem, a Diagnostic Trouble Code (DTC) will be stored in the PCM's memory, and eventually may illuminate the Check Engine Lamp constantly while the key is on. If the problem is repaired, or is intermittent, the ECM will erase the DTC after 40 warm-up cycles without the fault detected. A warm-up cycle consists of starting the vehicle when the engine is cold, then the engine is warmed up to a certain temperature, and finally, the engine temperature falls to a normal operating temperature, then the key is turned off.

Certain criteria must be met for a DTC to be entered into ECM memory. The criteria may be a specific range of engine rpm, engine or fuel temperature and/or input voltage to the ECM. A DTC indicates that the ECM has identified an abnormal signal in a circuit or the system. A DTC may indicate the result of a failure, but never identify the failed component directly.

There are several operating conditions that the ECM does not monitor and set a DTC for. Refer to the following Monitored Circuits and Non-Monitored Circuits in this section.

ECM MONITORED SYSTEMS

The ECM can detect certain problems in the electrical system.

Open or Shorted Circuit – The ECM will not distinguish between an open or a short to ground, however the ECM can determine if the circuit is shorted to voltage.

Output Device Current Flow – The ECM senses whether the output devices are electrically connected.

If there is a problem with the circuit, the ECM senses whether the circuit is open, shorted to ground (–), or shorted to (+) voltage.

ECM NON-MONITORED SYSTEMS

The ECM does not monitor the following circuits, systems or conditions that could have malfunctions that result in driveability problems. A DTC will not be displayed for these conditions.

Fuel Pressure: Fuel pressure is controlled by the fuel injection pump. The ECM cannot detect fuel pressure problems in this component. The ECM does a comparison analysis of fuel quantity, fuel timing, fuel temperature, and control sleeve sensor inputs to determine if a fuel problem exists.

Cylinder Compression: The ECM cannot detect uneven, low, or high engine cylinder compression.

DESCRIPTION AND OPERATION (Continued)

Exhaust System: The ECM cannot detect a plugged, restricted or leaking exhaust system.

Fuel Injector Malfunctions: The ECM cannot determine if the fuel injector is clogged, or the wrong injector is installed. The fuel injectors on the diesel engine are **not controlled** by the ECM, although a defective needle movement sensor in the #1 injector **is monitored** by the ECM.

Vacuum Assist: Leaks or restrictions in the vacuum circuits of the Exhaust Gas Recirculation System (EGR) are not monitored by the ECM.

ECM System Ground: The ECM cannot determine a poor system ground. However, a DTC may be generated as a result of this condition.

ECM/PCM Connector Engagement: The ECM cannot determine spread or damaged connector pins. However, a DTC may be generated as a result of this condition.

HIGH AND LOW LIMITS

The ECM compares input signals from each input device. It has high and low limits that are programmed into it for that device. If the inputs are not within specifications and other DTC criteria are met, a DTC will be stored in memory. Other DTC criteria might include engine rpm limits or input voltages from other sensors or switches. The other inputs might have to be sensed by the ECM when it senses a high or low input voltage from the control system device in question.

DIAGNOSTIC TROUBLE CODES

DESCRIPTION

On the following pages, a list of DTC's is provided for the 2.5L diesel engine. A DTC indicates that the ECM has recognized an abnormal signal in a circuit or the system. A DTC may indicate the result of a failure, but most likely will not identify the failed component directly.

ACCESSING DIAGNOSTIC TROUBLE CODES

A stored DTC can be displayed through the use of the DRB III® scan tool. The DRB III® connects to the data link connector. The data link connector is located under the instrument panel near bottom of the steering column (Fig. 1) (Fig. 2).

Fig. 1 Data Link Connector Location—LHD

1 - 16-WAY DATA LINK CONNECTOR

Fig. 2 Data Link Connector Location—RHD

1 - DATA LINK CONNECTOR

ERASING TROUBLE CODES

After the problem has been repaired, use the DRB III® scan tool to erase a DTC.

DESCRIPTION AND OPERATION

VACUUM HOSE ROUTING SCHEMATIC

DESCRIPTION

Vacuum for the EGR system is supplied by the internal engine mounted vacuum pump. Refer to EGR System Operation for vacuum pump information. Vacuum harness routing for emission related components is displayed in (Fig. 1).

Fig. 1 Typical Hose Routing

- 1 - EGR VALVE
- 2 - TO VACUUM PUMP
- 3 - ELECTRIC VACUUM MODULATOR (EVM)

EXHAUST GAS RECIRCULATION (EGR) SYSTEM

DESCRIPTION

The EGR system reduces oxides of nitrogen (NO_x) in the engine exhaust. This is accomplished by allowing a predetermined amount of hot exhaust gas to recirculate and dilute the incoming fuel/air mixture.

A malfunctioning EGR system can cause engine stumble, sags or hesitation, rough idle, engine stalling and poor driveability.

OPERATION

The system consists of:

- An EGR valve assembly. The valve is located on the side of the intake manifold.
- An Electric Vacuum Modulator (EVM). The EVM is sometimes referred to as the EGR control solenoid or EGR duty cycle solenoid. The EVM controls the "on time" of the EGR valve.
- The ECM operates the EVM. The ECM is located inside the vehicle under the instrument panel.
- An EGR tube connects a passage in the EGR valve to the rear of the exhaust manifold.
- The vacuum pump supplies vacuum for the EVM and the EGR valve. This pump also supplies vacuum for operation of the power brake booster and the heating and air conditioning system. The pump is located internally in the front of the engine block (Fig. 2) and is driven by the crankshaft gear.
- Vacuum lines and hoses connect the various components.

When the ECM supplies a variable ground signal to the EVM, EGR system operation starts to occur. The ECM will monitor and determine when to supply and remove this variable ground signal. This will depend on inputs from the engine coolant temperature, throttle position and engine speed sensors.

DESCRIPTION AND OPERATION (Continued)

**Fig. 2 Internal Vacuum Pump**

1 – INTERNAL VACUUM PUMP AND DRIVE GEAR

When the variable ground signal is supplied to the EVM, vacuum from the vacuum pump will be allowed to pass through the EVM and on to the EGR valve with a connecting hose.

Exhaust gas recirculation will begin in this order when:

- The ECM determines that EGR system operation is necessary.
- The engine is running to operate the vacuum pump.
- A variable ground signal is supplied to the EVM.
- Variable vacuum passes through the EVM to the EGR valve.
- The inlet seat (poppet valve) at the bottom of the EGR valve opens to dilute and recirculate exhaust gas back into the intake manifold.

The EGR system will be shut down by the ECM after 60 seconds of continuous engine idling to improve idle quality.

DIAGNOSIS AND TESTING**EGR GAS FLOW TEST**

Refer to the 2000 XJ Diesel Powertrain Diagnostic Manual for complete test procedure.

EGR SOLENOID TEST**VACUUM TEST**

With the engine running, disconnect the vacuum supply line at the fitting on the Electric Vacuum Modulator (EVM). Vacuum should be no less than 20 inches. If vacuum is lower, check for leaks in vacuum supply line. If leaks cannot be found, check for low vacuum at vacuum pump.

REMOVAL AND INSTALLATION**EGR VALVE****REMOVAL**

- (1) Disconnect vacuum line at EGR valve vacuum supply fitting.
- (2) Loosen the tube fitting at exhaust manifold end of EGR tube.
- (3) Remove the two bolts retaining the EGR tube to the EGR valve and remove the EGR tube.
- (4) Remove the two bolts retaining the EGR valve to the intake manifold elbow and remove EGR valve.
- (5) Discard both of the old EGR mounting gaskets.

INSTALLATION

- (1) Clean the intake manifold of any old gasket material.
- (2) Clean the end of EGR tube of any old gasket material.
- (3) Position the EGR valve and new gasket to the intake manifold elbow.
- (4) Install two EGR valve mounting bolts. Do not tighten bolts at this time.
- (5) Position new gasket between EGR valve and EGR tube.
- (6) Install two EGR tube bolts. Tighten all four mounting bolts to 23 N·m (204 in. lbs.).
- (7) Tighten EGR tube fitting at exhaust manifold.
- (8) Connect vacuum line to EGR valve.

EGR TUBE

The EGR tube connects the EGR valve to the rear of the exhaust manifold.

REMOVAL

- (1) Remove two EGR tube mounting bolts at EGR valve end of tube.
- (2) Loosen fitting at exhaust manifold end of tube.
- (3) Remove EGR tube and discard old gasket.
- (4) Clean gasket mating surfaces and EGR tube flange gasket surfaces.
- (5) Check for signs of leakage or cracked surfaces at both ends of tube, exhaust manifold and EGR valve.

INSTALLATION

- (1) Install a new gasket to EGR valve end of EGR tube.
- (2) Position EGR tube to engine.
- (3) Loosely tighten fitting at exhaust manifold end of tube.
- (4) Install 2 mounting bolts at EGR valve end of tube. Tighten bolts to 23 N·m (204 in. lbs.) torque.
- (5) Tighten fitting at exhaust manifold end of tube.

REMOVAL AND INSTALLATION (Continued)

ELECTRIC VACUUM MODULATOR (EVM)

The EVM (EGR Duty Cycle Solenoid) is mounted behind the PCM.

REMOVAL

- (1) Disconnect the negative battery cable.
- (2) Disconnect two vacuum hoses at EVM (Fig. 3).
- (3) Remove mounting screws of EVM (Fig. 3).
- (4) Remove the EVM to gain access to the EVM electrical connector.
- (5) Remove electrical connector at EVM.

INSTALLATION

- (1) Install electrical connector to EVM.
- (2) Install EVM and tighten mounting screws (Fig. 3).
- (3) Connect vacuum hoses (Fig. 3).
- (4) Connect the negative battery cable.

NOTES

1.0 INTRODUCTION

The procedures contained in this manual include all the specifications, instructions, and graphics needed to diagnose 2001 body system problems. The diagnostics in this manual are based on the failure condition or symptom being present at the time of diagnosis.

Please follow the recommendations below when choosing your diagnostic path.

1. First make sure the DRBIII® is communicating with the appropriate modules; i.e., if the DRBIII® displays a “No Response” condition, you must diagnose that first.
2. Read DTC's (diagnostic trouble codes) with the DRBIII®.
3. If no DTC's are present, identify the customer complaint.
4. Once the DTC or customer complaint is identified, locate the matching test in the Table of Contents and begin to diagnose the symptom.

All component location views are in Section 8.0. All connector pinouts are in Section 9.0. All schematics are in Section 10.0.

An * placed before the symptom description indicated a customer complaint.

When repairs are required, refer to the appropriate service manual for the proper removal and repair procedure.

Diagnostic procedures change every year. New diagnostic systems may be added: carryover systems may be enhanced. **READ THIS MANUAL BEFORE TRYING TO DIAGNOSE A VEHICLE DIAGNOSTIC TROUBLE CODE.** It is recommended that you review the entire manual to become familiar with all new and changed diagnostic procedures.

This book reflects many suggested changes from readers of past issues. After using this book, if you have any comments or suggestions, please fill out the back of the book and mail it back to us.

1.1 SYSTEM COVERAGE

This diagnostic manual covers 2001 Jeep Cherokee (XJ) vehicles.

1.2 SIX STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the body system is done in six basic steps:

- Verification of complaint
- Verification of any related symptoms
- Symptom analysis
- Problem isolation

- Repair of isolated problem
- Verification of proper operation

2.0 IDENTIFICATION OF SYSTEM

The vehicle systems that are part of the “body” system are:

- Airbag System (ACM)
- Compass Mini-Trip Computer (CMTC)
- Mechanical Instrument Cluster (MIC)
- Remote Keyless Entry (RKE)
- Vehicle Communication

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

The body system on the 2001 Jeep Cherokee consists of five modules that communicate over the CCD bus (Chrysler Collision Detection multiplex system). There are two additional modules, the Powertrain Control Module (PCM) and the Transmission Control Module (TCM) that are not part of the body system, but do utilize the CCD bus for communication. The TCM also utilizes the bus for diagnostics. The PCM sends and receives messages on the CCD bus; however, diagnostics are performed through the Serial Communication Interface or SCI, the same as last year. All of the information about the functioning of all the systems is organized, controlled and communicated by the CCD bus, described in Section 3.6 (Vehicle Communication) of this general information.

Through the CCD bus, information about the operation of vehicle components and circuits is relayed quickly to the appropriate module(s). All modules receive all the information transmitted on the bus although a module may not require all information to perform its function. Each module will only respond to messages “addressed” to it through a binary coding process. This method of data transmission significantly reduces the complexity of the wiring in the vehicle and the size of wiring harnesses.

When replacing a blown fuse, it is important to use only a fuse having the correct amperage rating. The use of a fuse with a rating other than indicated may result in a dangerous electrical system overload. If a properly rated fuse continues to blow, it indicates a problem in the circuit that must be corrected.

When replacing any bulbs, do not touch the new bulb with your fingers. Oil contamination will se-

GENERAL INFORMATION

verely shorten bulb life. If the new bulb comes in contact with an oily surface, clean the bulb with rubbing alcohol.

3.1 AIRBAG SYSTEM

A dual front airbag system is a standard equipment safety feature on this model. The airbag system is designed to provide increased driver and passenger protection if the vehicle is involved in a front-end collision. A DRBIII® scan tool is required for diagnosis of the airbag system. The system is the most effective when used in conjunction with the seat belt system. The airbag system consists of the Airbag Control Module (ACM), Mechanical Instrument Cluster (MIC), driver and hybrid passenger airbag module, clock spring, data link connector and the Chrysler Collision Detection multiplex system (CCD bus). There are no external impact sensors in this system.

The ACM is an electronic module that monitors the airbag system for proper operation, stores Diagnostic Trouble Codes (DTCs), controls the airbag warning lamp, and contains an energy storage capacitor. This capacitor stores enough electrical energy to deploy the airbags for up to one second following a battery disconnect or failure during an impact. The purpose of the capacitor is to provide airbag system protection in a severe secondary impact if the initial impact has damaged or disconnected the battery, but was not severe enough to deploy the airbag.

The ACM is mounted on the center tunnel floor pan of the vehicle, behind the parking brake mechanism. The ACM provides DTCs to the technician through the DRBIII® via the CCD bus. Some circuits are tested continuously; others are checked only under certain circumstances. The Mechanical Instrument Cluster (MIC) turns the warning lamp on or off based on CCD bus messages from the ACM. The ACM cannot be repaired and must be replaced if it is damaged or faulty.

THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTROMECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY AIRBAG SYSTEM OR RELATED STEERING WHEEL, STEERING COLUMN OR INSTRUMENT PANEL COMPONENTS, YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO THIS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NEVER STRIKE OR KICK THE AIRBAG CONTROL MODULE BECAUSE IT CAN DAMAGE THE IMPACT SENSOR OR AFFECT ITS CALIBRATION. IF AN AIRBAG CONTROL MODULE IS ACCIDENTALLY DROPPED DURING SERVICE, THE MODULE MUST BE SCRAPPED AND REPLACED WITH A NEW UNIT.

The deceleration or g-force resulting from the impact of a front-end collision causes the safing sensor inside the ACM to close. As soon as the ACM internal accelerometer and the safing sensor are closed an electrical charge is sent to the airbag module. This causes the inflator to be actuated, thus deploying the airbags. The total time from the closure of the sensors to deployment and deflation of the airbags is 1/10 of one second.

The AIRBAG warning lamp is the only point at which “symptoms” of a system malfunction can be observed by the customer. Whenever the ignition key is turned to “run” or “start” position, the MIC performs a lamp check by turning the AIRBAG warning lamp on for six to eight seconds. If after that the lamp turns off, it means that the ACM has checked the system and found it to be free of discernible malfunctions. If the lamp remains on, there could be an active fault in the system or the MIC lamp circuit may be defective. If the lamp comes on and stays on for a period longer than six to eight seconds and then goes off, there is usually an intermittent problem in the system. The MIC monitors the airbag warning lamp for an open or defective lamp driver circuit. This information is sent to the ACM via a CCD bus message. The CCD bus messages listed below can be monitored using DRBIII® and selecting “passive restraints,” “AIRBAG,” “MONITOR DISPLAY,” and “WARNING LAMP STATUS.”

ACM LAMP REQUEST (on or off)

MIC BULB STATE (ok or failed)

MIC DRIVER STATE (ok or failed)

Perform the WARNING LAMP CIRCUIT OPEN procedure in this book to find the cause of any customer complaint regarding the AIRBAG warning lamp, such as:

- Warning lamp does not illuminate
- Warning lamp stays illuminated with no active DTCs

NOTE: THE AIRBAG WARNING LAMP WILL BE ILLUMINATED IF THE INSTRUMENT CLUSTER LOSES CCD BUS COMMUNICATION WITH THE AIRBAG MODULE OR PCM. THE CCD BUS SYSTEM MUST BE REPAIRED FIRST.

Service and general information labels about the airbag system can be found on the driver's sun visor, and in the engine compartment.

To ensure that the airbag will be ready to deploy in a collision, have the system serviced by an authorized dealer.

IMPORTANT NOTE: IF THE POWERTRAIN CONTROL MODULE HAS BEEN CHANGED AND THE CORRECT VIN AND MILEAGE HAVE NOT BEEN PROGRAMMED, A DTC WILL BE SET IN THE AIRBAG MODULE. IN ADDITION, IF THE VEHICLE IS EQUIPPED WITH A SENTRY KEY IMMOBILIZER MODULE (SKIM). SECRET KEY DATA MUST BE UPDATED TO ENABLE STARTING.

FOR AIRBAG SYSTEM:

ACTION:

1. Enter correct VIN and Mileage in PCM.
2. Erase codes in Airbag module.

DRIVER AIRBAG MODULE (DAB)

The Driver Airbag Module (DAB) protective trim cover is the most visible part of the driver side airbag system. The module is mounted directly to the steering wheel. The protective trim cover is fitted to the front of the airbag module and forms a decorative cover in the center of the steering wheel. Upon airbag deployment, this cover will split at a predetermined breakout line. Located under the airbag module trim cover are the horn switch, the airbag cushion and the airbag cushion supporting components. The airbag module includes a housing to which the cushion and inflator are attached and sealed. The airbag module cannot be repaired and must be replaced if deployed or is damaged or defective in any way. The inflator assembly is mounted to the back of the airbag module. When supplied with the proper electrical signal, the inflator seals the hole in the airbag cushion so it can discharge the gas it produces directly into the cushion.

THE AIRBAG MODULE INFLATOR ASSEMBLY CONTAINS SODIUM AZIDE AND POTASSIUM NITRATE. THESE MATERIALS ARE POISONOUS AND EXTREMELY FLAMMABLE. CONTACT WITH ACID, WATER OR HEAVY METALS MAY PRODUCE HARMFUL OR IRRITATING GASES (SODIUM HYDROX-

IDE IS FORMED IN THE PRESENCE OF MOISTURE) OR COMBUSTIBLE COMPOUNDS. IN ADDITION, THE PASSENGER AIRBAG MODULE CONTAINS ARGON GAS PRESSURIZED TO OVER 2500 PSI. DO NOT ATTEMPT TO DISMANTLE AN AIRBAG MODULE OR TAMPER WITH ITS INFLATOR. DO NOT PUNCTURE, INCINERATE OR BRING INTO CONTACT WITH ELECTRICITY. DO NOT STORE AT TEMPERATURES EXCEEDING 93°C (200°F).

The DAB is connected to the ACM through a mechanical device called a clock spring. The clock-spring allows the DAB to be hardwired through the steering wheel to the ACM. A yellow quick disconnect connector is located under the steering column at the lower edge of the knee blocker panel. This connector when disconnected will disable both the DAB and PAB modules.

THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTROMECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY AIRBAG SYSTEM OR RELATED STEERING, STEERING COLUMN OR INSTRUMENT PANEL COMPONENTS, YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO THIS COULD RESULT IN ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY. WHEN A STEERING COLUMN HAS AN AIRBAG MODULE ATTACHED, NEVER PLACE THE COLUMN ON THE FLOOR OR ON ANY OTHER SURFACE WITH THE STEERING WHEEL OR AIRBAG MODULE FACE DOWN.

PASSENGER AIRBAG MODULE (PAB)

The airbag door on the instrument panel above the glove box is the most visible part of the passenger side airbag system. Under the airbag door are the airbag cushion and its supporting components. The airbag module includes a housing to which the cushion, inflator and canister of compressed gas are attached and sealed. The airbag module cannot be repaired and must be replaced if deployed or damaged. The inflator seals the hole in the airbag cushion so it can discharge the gas it produces directly into the cushion when supplied with the proper electrical signal. The airbag door is secured to the airbag module and the instrument panel base, and has predetermined breakout lines concealed beneath its decorative cover. Upon airbag deployment, the airbag door will split at the breakout lines and the door will pivot out of the way. The

GENERAL INFORMATION

airbag door is serviced as a unit with the airbag module. If an airbag module assembly is defective and non-deployed, refer to the Chrysler Corporation current parts return list in the Warranty Policies and Procedures manual for the proper handling procedures.

THE AIRBAG MODULE INFLATOR ASSEMBLY CONTAINS SODIUM AZIDE AND POTASSIUM NITRATE. THESE MATERIALS ARE POISONOUS AND EXTREMELY FLAMMABLE. CONTACT WITH ACID, WATER OR HEAVY METALS MAY PRODUCE HARMFUL AND IRRITATING GASES (SODIUM HYDROXIDE IS FORMED IN THE PRESENCE OF MOISTURE) OR COMBUSTIBLE COMPOUNDS, IN ADDITION, THE PASSENGER AIRBAG MODULE CONTAINS ARGON GAS PRESSURIZED TO OVER 2500 PSI. DO NOT ATTEMPT TO DISMANTLE AN AIRBAG MODULE OR TAMPER WITH ITS INFLATOR. DO NOT PUNCTURE, INCINERATE OR BRING INTO CONTACT WITH ELECTRICITY. DO NOT STORE AT TEMPERATURES EXCEEDING 93°C (200°F).

A yellow quick disconnect connector is located under the steering column at the lower edge of the knee blocker panel. This connector when disconnected will disable both the DAB and PAB module.

THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTROMECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY AIRBAG SYSTEM OR RELATED STEERING WHEEL, STEERING COLUMN OR INSTRUMENT PANEL COMPONENTS, YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO THIS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

REPLACE AIRBAG SYSTEM COMPONENTS ONLY WITH PARTS SPECIFIED IN THE CHRYSLER MOPAR PARTS CATALOG. SUBSTITUTE PARTS MAY APPEAR INTERCHANGEABLE, BUT INTERNAL DIFFERENCES MAY RESULT IN INFERIOR OCCUPANT PROTECTION. THE FASTENERS, SCREWS AND BOLTS ORIGINALLY USED FOR THE AIRBAG SYSTEM COMPONENTS HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANYTIME A NEW FASTENER IS NEEDED, RE-

PLACE IT WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR SPECIFIED IN THE CHRYSLER MOPAR PARTS CATALOG.

3.1.1 AIRBAG DIAGNOSTIC TROUBLE CODES

Airbag diagnostic trouble codes consist of active and stored codes. If more than one code exists, diagnostic priority should be given to the active code(s).

Each diagnostic trouble code is diagnosed by following a specific testing procedure. The diagnostic test procedures contain step-by-step instructions for determining the cause of the trouble codes. It is not necessary to perform all of the tests in this book to diagnose an individual code.

Active diagnostic trouble codes for the airbag system are not permanent and will change the moment the reason for the code is corrected. In certain test procedures within this manual, diagnostic trouble codes are used as a diagnostic tool.

3.1.2 ACTIVE CODES

An active trouble code indicates an ongoing malfunction. This means that the defect is currently there every time the airbag control module checks that circuit/function. It is impossible to erase an active code; active codes automatically erase by themselves when the reason for the code has been corrected.

With the exception of the warning lamp trouble codes or malfunctions, when a malfunction is detected the AIRBAG lamp remains lit for a minimum of 12 seconds or as long as the malfunction is present.

3.1.3 STORED CODES

Airbag codes are automatically stored in the ACM's memory after 1 minute of occurrence or when the ignition is turned off. The exception is the "Loss of Ignition Run Only" code which is an active code only.

A "stored" code indicates there was an active code present at some time. However, the code currently **may not be present** as an active code although another active code could be.

When a trouble occurs, the AIRBAG warning lamp illuminates for 12 seconds minimum (even if the problem existed for less than 12 seconds). The code is stored, along with the time in minutes it was active, and the number of times the ignition has been cycled since the problem was last detected.

The minimum time shown for any code will be one minute, even if the code was actually present for less than one minute. Thus, the time shown for

a code that was present for two minutes 13 seconds, for example, would be three minutes.

If a malfunction is detected, a diagnostic trouble code is stored and will remain stored as long as the malfunction exists. When and if the malfunction ceases to exist, an ignition cycle count will be initiated for that code. If the ignition cycle count reaches 100 without a recurrence of that same malfunction, that diagnostic trouble code is erased and that ignition cycle counter is reset to zero. If the malfunction recurs before the count reaches 100, then the ignition cycle counter will be reset and the diagnostic trouble code will continue to be a stored code.

If a malfunction is not active while performing a diagnostic text procedure, the active code diagnostic test will not locate the source of the problem. In this case, the stored code can indicate an area to inspect.

If no obvious problems are found, erase stored codes. With the ignition "on," wiggle the wire harness and connectors, then rotate the steering wheel from stop to stop. Recheck for codes periodically as you work through the system. This procedure may uncover a malfunction that is difficult to locate.

3.1.4 AIRBAG TROUBLE CODES

The airbag control module may report any of the following diagnostic trouble codes.

For the following active or stored codes, replace the Airbag Control Module (ACM):

- AECM Accelerometer
- Internal Diagnostic 1
- Internal Diagnostic 2
- AECM Output Driver
- AECM Stored Energy Logic
- AECM Stored Energy Driver
- AECM Stored Energy Passenger
- Internal Diagnostic 3
- Internal Diagnostic 4
- Safing Sensor Shorted

For these codes, refer to the appropriate diagnostic procedure:

- Driver Squib Circuit Open
- Driver Squib Circuit Shorted
- Loss of Ignition Run Only
- Loss of Ignition Run/Start
- No Cluster CCD Bus Message
- No CCD Communication
- Passenger Squib Circuit Open
- Passenger Squib Circuit Shorted
- Either Squib Term Shorted to Battery
- Either Squib Term Shorted to Ground

- Warning Lamp Circuit Open/Shorted

3.2 COMPASS/MINI-TRIP COMPUTER

The Compass/Mini-Trip Computer (CMTC) is in the overhead console. It displays the following information:

- Compass direction
- Current outside temperature
- Elapsed Time (ET)
- Distance To Empty (DTE)
- Average Fuel Economy (AVE ECO)
- Instantaneous Fuel Economy (ECO)
- Trip Odometer (ODO)

All of the information required by the CMTC except the ambient temperature and compass direction is transmitted over the CCD bus.

The CMTC can perform an independent self-test. This can be accomplished by using either the DRB or pressing both US/M and STEP buttons and then turning the ignition key on. All segments of the CMTC should light while the CMTC checks its internal function. If there are internal failures, the CMTC will display "FAIL." If there is a problem with the CCD communication, the CMTC will display "CCD." Refer to the "Compass/Mini-Trip" section of this manual for further diagnosis.

3.2.1 SETTING THE COMPASS

The compass/mini-trip module is self-calibrated and requires no adjustment. The word CAL will be displayed to indicate that the compass is in the fast calibrating mode. CAL will turn off after the vehicle has gone in three complete circles without stopping, in an area free of magnetic disturbance.

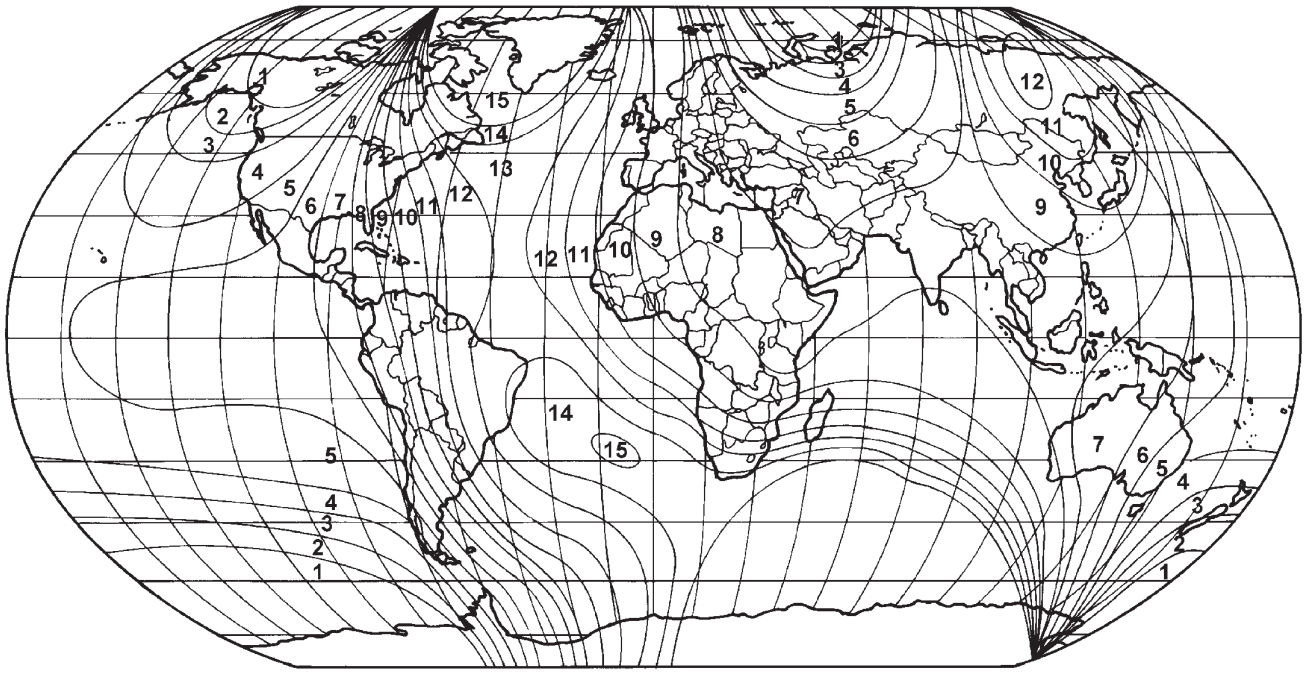

If the module displays the temperature while the compass is blank, or displays a false reading, the vehicle must be demagnetized. See the service manual for the proper procedure.

If the compass still goes blank after the vehicle is demagnetized, the compass/mini-trip module must be replaced.

3.2.2 SETTING THE COMPASS VARIANCE

Variance is the difference between magnetic north and geographic north. To determine the variance for the area you are in, refer to the zone map on the next page. The number shown for your area is the variance number for your area.

1. Set the compass/mini-trip console to compass/temperature mode.
2. Press and hold down both the US/METRIC button and the STEP button for 5 seconds.
3. The VAR light will come on and the last variance setting will be displayed.

80a13863

4. Enter the correct variance number by pressing the US/M button.
5. Press the STEP button to set the zone number and resume normal operation.

NOTE: DO NOT ATTACH ANY MAGNETIC DEVICE SUCH AS A MAGNETIC CB ANTENNA TO THE VEHICLE. THIS CAN CAUSE THE COMPASS TO GIVE FALSE READINGS.

3.3 INSTRUMENT CLUSTER

The instrument cluster for Jeep Cherokee (XJ) is available in two different versions: base with two gauges, and premium with six gauges. The gauges are positioned with information received by the cluster over the CCD bus from the PCM. Some of the warning lamps are hardwired; and some are controlled by the cluster, using CCD bus information. The vehicle chime function is contained on the cluster circuit board, as well as the timer for the rear window defogger. There is a self-test available for the cluster that will actuate all the gauges and place them at their calibration points. The test will not run if the cluster sees engine RPM or vehicle speed. This test will light all CCD controlled lamps for verification of lamp operation. It also forces the odometer Vacuum Fluorescent (VF) display to count up from all zero's through all nine's. The self-test routine can be entered by pushing and holding the trip reset button, while rotating the ignition key from the "off" to the "on" position, release the button after the ignition key cycle.

The VF display is also capable of displaying PCM DTC's. This feature is accessed the same as in previous years by turning the key from "off" to "run" three times and staying in position.

The instrument cluster will provide bus bias and termination and the PCM controller provides a second termination. If cluster is disconnected, the bus will not be biased.

The cluster will be serviced as an assembly. There will be limited parts available: bulbs and sockets, the front lens, the trip odometer stem cover and the hood and rear cover assembly. No internal parts of the lowline or highline cluster will be serviced.

Normal Operation: At key "on", the cluster will light the low fuel, oil pressure, temperature battery, seat belt, check gauges and airbag lamps. The check engine, ABS, and SKIM lamps are bulb tested by their system modules. As the key is turned farther toward the start position, the brake warning lamp will illuminate. The Vacuum Fluorescent (VF) display will indicate the mileage stored inside the cluster. If there is a bus failure and the cluster cannot receive distance pulses from the engine controller, the cluster will display the last mileage stored until the ignition key is turned off. If the cluster is receiving bus messages, but is unable to display odometer information because of an internal failure, the odometer display dashes. VF dimming is handled by the potentiometer that controls instrumentation illumination.

3.3.1 HEATED REAR WINDOW DEFOGGER

The timing circuit for the rear window defogger is contained in the cluster. The operation is as follows:

With the ignition on, the first push of the defogger button will start a 10-minute timer. After 10 minutes have elapsed, the defogger will be turned off. If the button is pushed a second time during the same ignition cycle, the timer will turn the defogger on for five minutes. Every consecutive push will operate the defogger for five minutes. When the defogger is on, it can be turned off with a second push of the defogger button.

3.3.2 CHIME

The chime function is a 1000 Hz tone within the cluster. The cluster will not generate more than one chime per condition in the same ignition cycle. If a problem occurs that requires a second chime while the first one is currently being generated, the second chime request will be ignored. The chime will sound for the following conditions:

- Headlamps on and driver's door open
- Seat Belt Warning — Six seconds after key on
- Key in Ignition Warning — Driver's front door open with key in ignition
- Engine Temp High — When gauges enter red zone
- Low Fuel — When fuel reaches 1/8 of a tank
- When overhead console is reset
- Skim key successfully programmed

3.3.3 LAMPS (HARDWIRED)

The following lamps are hardwired to the cluster and are not part of the self-test:

- Brake Warning (Red) - bulb test performed when the ignition switch is turned to the crank position
- Full Time 4WD
- Part Time 4WD
- High Beam
- Left Turn Signal
- Liftgate Ajar

The following lamps are bulb tested at ignition on by the appropriate system module.

- ABS (Amber)
- Check engine
- SKIM

3.3.4 LAMPS (CCD)

The following lamps are controlled by the cluster via CCD messages. They are bulb tested (actuated) during the self-test procedure.

- Airbag
- Cruise Control
- Low Fuel Warning
- Low Washer Fluid
- Upshift (If equipped)
- Seat Belt
- Sentry Key Immobilizer
- Engine Temp (If equipped)
- Battery (If equipped)
- Low Oil Pressure Warning (If equipped)
- Check Gauges

The lowline cluster does not contain a check gauges telltale.

NOTE: THE SEAT BELT AND LOW WASHER FLUID SWITCHES ARE HARDWIRED TO THE CLUSTER. THE CLUSTER THEN DECIDES IF THE LAMP SHOULD ILLUMINATE BASED ON THE HARDWIRED INPUT.

3.3.5 DIAGNOSTICS

3.3.5.1 Gauges

The Mechanical Instrument Cluster (MIC) will not store any DTCs. Because the Powertrain Control Module (PCM) gathers all the gauge information and sends it to the cluster via the bus, it is the PCM's responsibility to monitor these inputs and store DTCs for them. For this reason, the first item to be checked regarding a gauge problem (except oil pressure) should be the PCM for any DTCs relating to the gauge in question.

There are DTCs associated with all the gauges except for the oil pressure gauge. When diagnosing gauges, the input that is used for the gauge message (fuel level sender, for example) must be valid. Because of OBD II requirements, most of the information used for monitoring the OBD II system is the same information used by the controller to formulate the gauge bus messages. OBD II requirements state the fuel level sender must be checked for rationality. This includes determining if the sending unit voltage is too high or too low, or if the voltage has not changed over time. If the PCM has determined the sender information is not valid, it will set the DTC. The presence or absence of the fuel level sending code in the PCM is an important factor to determine whether a fuel gauge problem is in the sending unit or the cluster.

This same situation is used in all cluster diagnostics related to gauge operation with the exception of the oil pressure gauge. OBD II requirements do not include oil pressure monitoring. Therefore, oil pressure diagnostics would dictate that a mechanical oil pressure gauge be attached to the engine for absolute verification of oil pressure readings.

3.3.5.2 Hardwired Lamps

The cluster contains several hardwired lamps described earlier. These lamps are set up in two configurations: The lamp is supplied power by the cluster and the ground is supplied by the circuit being monitored, or the lamp is supplied with a ground in the cluster and power comes from a module or other device. Refer to the schematic in General Information for the specific details on the lamp in question. Verification of the bulb filament

GENERAL INFORMATION

may be required in all cases of an inoperative lamp. This will require removal of the cluster and bulb in question.

3.3.5.3 CCD Controlled Lamps

The cluster contains several CCD controlled lamps as described earlier. These lamps are part of the diagnostic self-test. When entering the self-test mode, operation of these lamps can be observed. If the bulb fails to operate during the self-test and the bulb filament is good, the cluster assembly will need to be replaced.

3.4 REMOTE KEYLESS ENTRY (RKE)

The Remote Keyless Entry (RKE) module is in the overhead console or in the dome lamp assembly. It operates on a RF signal, which makes it less dependent on the aiming of the transmitter. When an unlock signal is received (from a transmitter), the module will ground the unlock control circuit, therefore actuating the passenger door module and at the same time grounding the courtesy lamps driver circuit, actuating the illuminated entry. The RKE module is capable of retaining four individual vehicle access codes (four transmitters). This system incorporates a rolling code feature. A horn chirp feature is also part of this system and is customer programmable.

The RKE module has some DRBIII® functions. The Door Lock, Door Unlock, Horn and Illuminated Entry can be actuated. The horn and illuminated entry activation time is adjustable using the DRBIII®. The DRBIII® can also turn the horn chirp and illuminated entry on and off.

The XJ will be shipped with the horn chirp enabled. It can be deactivated manually using the following procedure: Press and hold the LOCK button on the transmitter for 5-10 seconds, and then while the LOCK button is pressed, press and release the UNLOCK button. The horn chirp feature can be reactivated by repeating the procedure.

3.4.1 PROGRAMMING AN RKE TRANSMITTER

Programming a transmitter can be accomplished using the DRBIII®. Using the DRBIII® select "Theft Alarm," "VTSS" (even though "Vehicle Theft Security System" is not available for this vehicle) then "Miscellaneous" then "Programming RKE". Select a transmitter (1 - 4). The locks will cycle to verify you are in programming mode. Press the unlock button on the transmitter. The locks will cycle again to verify programming has taken place. When you program to a position, that code will overwrite the code that was in that position and because you have no way of knowing if a valid code was there or not,

it is recommended that whenever it is necessary to program a transmitter, all transmitters that are to be used with that vehicle should be programmed at that time.

3.4.2 SYNCHRONIZATION (ROLLING CODE) BUTTON TRANSMITTERS

The transmitter will go out of synchronization if the button is pressed more than 128 times outside of the range of the receiver. In other words the transmitter will not unlock the doors. The transmitter will go out of synchronization if the batteries are removed and replaced. To synchronize the code of the particular transmitter with the receiver, press and hold the "lock" button while within the receiver range.

3.5 SENTRY KEY IMMOBILIZER SYSTEM (SKIS)

The Sentry Key Immobilizer System (SKIS) is an immobilizer system designed to prevent unauthorized vehicle operation. The system consists of a Sentry Key Immobilizer Module (SKIM), ignition key(s) equipped with a transponder chip and engine controller. When the ignition switch is turned on, the SKIM interrogates the ignition key. If the ignition key is "Valid" the SKIM sends a CCD Bus message to the engine controller indicating the presence of a valid ignition key. Upon receiving a "Valid" key signal the PCM will allow the engine to continue to operate.

3.5.1 SKIS OPERATION

When ignition power is supplied to the SKIM, the SKIM performs an internal self-test. After the self-test is completed, the SKIM energizes the antenna (this activates the transponder chip) and sends a challenge to the transponder chip. The transponder chip responds to the challenge by generating an encrypted response message using the following:

Secret Key — This an electronically stored value (identification number) that is unique to each SKIS. The secret key is stored in the SKIM, PCM and all ignition key transponders.

Challenge — This is a random number that is generated by the SKIM at each ignition key cycle.

The secret key and challenge are plugged into an algorithm that produces the encrypted response message. The transponder uses the crypto algorithm to receive, decode and respond to the message sent by SKIM. After responding to the coded message, the transponder sends a transponder I.D. message to the SKIM. The SKIM compares the transponder I.D. to the available valid key codes in SKIM memory (8 key maximum). After validating the key the SKIM sends a CCD Bus message called

a “Seed Request” to the PCM then waits for a controller response. If the PCM does not respond, the SKIM will send the seed request again. After three failed attempts the SKIM will stop sending the seed request and store a trouble code. If the PCM sends a seed response, the SKIM sends a valid/invalid key message to the PCM. This is an encrypted message that is generated using the following:

VIN — Vehicle Identification Number

Seed — This is a random number that is generated by the PCM at each ignition key cycle.

The VIN and seed are plugged into a rolling code algorithm that encrypts the “valid/invalid key” message. The PCM uses the rolling code algorithm to receive, decode and respond to the valid/invalid key message sent by SKIM. After sending the valid/invalid key message the SKIM waits 3.5 seconds for a PCM status message from the PCM. If the PCM does not respond with a valid key message to the SKIM, a fault is detected and trouble code stored.

The SKIS incorporates a warning lamp located in the instrument cluster. The lamp is actuated when the SKIM sends a CCD Bus message to the instrument cluster requesting the lamp on. The SKIM will request lamp operation for the following:

- bulb check at ignition on
- to alert the vehicle operator to a SKIS malfunction

For all faults except transponder faults and VIN mismatch, the lamp remains on steady. In the event of a transponder fault the light flashes at the rate of 1 Hz (once per second). If a fault is present the lamp will remain on or flashing for the complete ignition cycle. If a fault is stored in SKIM memory which prevents the system from operating properly, the PCM will allow the engine to start and run (for 2 seconds) up to six times. After the sixth attempt, the PCM disables the starter relay until the fault is corrected.

For additional information on the SKIS, refer to the appropriate “Powertrain Diagnostic Information”.

3.6 VEHICLE COMMUNICATION

The Chrysler Collision Detection multiplex system (CCD bus) consists of a twisted pair of wires. These wires run from one module to another. They receive and deliver coded information between the modules. The information is coded to identify the message, as well as the importance of the message. When there are multiple messages trying to access the CCD bus at one time, the code determines the message that has higher priority and is then allowed to access the bus first.

The two wires of the twisted pair that make up the CCD multiplex system are called “bus+” (bus plus) and “bus-” (bus minus) respectively. Each wire has a measurable voltage level of roughly 2.5 volts. In order to maintain the 2.5 volts on each line and provide a means of transportation for the coded messages, there is a “voltage divider network.” This network consists of the Mechanical Instrument Cluster (MIC) that supplies both bias and termination and the PCM that provides a second termination. Bias is the part of the voltage divider network that places both bus+ and bus- at 2.5 volts. Termination in the circuitry is required to complete the voltage divider network and it also provides some electromagnetic protection for the bus.

NOTE: COMMUNICATION OVER THE BUS IS ESSENTIAL TO THE PROPER OPERATION OF SOME VEHICLE SYSTEMS, ON BOARD DIAGNOSTIC (OBD) SYSTEMS AND COMMUNICATION WITH THE DRB. PROBLEMS WITH THE OPERATION OF THE BUS OR DRB MUST BE CORRECTED BEFORE PROCEEDING WITH DIAGNOSTIC TESTING. IF THERE IS A PROBLEM, REFER TO THE VEHICLE COMMUNICATIONS SECTION IN THIS MANUAL.

3.6.1 CCD BUS FAILURE MESSAGES

Short to Battery - Either or both of the bus wires are shorted to the battery potential, or a specific ground may be open.

Short to 5 Volts - Either or both of the bus wires are shorted to a 5-Volt potential.

Short to Ground - Either or both of the bus wires are shorted to ground.

Bus (+) and Bus (-)

Shorted Together - The two bus wires are shorted together.

Bus (+) Open - The bus (+) wire has lost connection with termination and/or bias.

Bus (-) Open - The bus (-) wire has lost connection with termination and/or bias.

Bus Bias

Level Too Low - Either or both of the bus wire potentials are significantly below their normal 2.5 volts.

Bus Bias

Level Too High - Either or both of the bus wire potentials are significantly above their normal 2.5 volts.

No Termination - The bus system has lost connection with all of its terminators. The Instrument Cluster (MIC) and Powertrain Control Module Supply Termination (PCM).

GENERAL INFORMATION

No Bus Bias - The bus system has lost connection with all modules that provide bias. The Instrument Cluster (MIC) provides the CCD bus bias.

Not Receiving Bus Messages

Correctly - The DRB cannot communicate over the bus and does not know why.

3.7 USING THE DRBIII®

Refer to the DRBIII® user's guide for instructions and assistance with reading trouble codes, erasing trouble codes, and other DRBIII® functions.

3.8 DRBIII® ERROR MESSAGES AND BLANK SCREEN

Under normal operation, the DRBIII® will display one of only two error messages:

- User-Requested WARM Boot or User-Requested COLD Boot

If the DRB should display any other error message, record the entire display and call the MDS Hotline, or call for information and assistance at 1-800-825-8737. This is a sample of such an error message display.

ver: 2.14
date: 26 Jul93
file: key_itf.cc
date: Jul 26 1993
line: 548
err: 0x1
User-Requested COLD Boot

Press MORE to switch between this display and the application screen.
Press F4 when done noting information.

3.8.1 DRBIII® DOES NOT POWER UP

If the LED's do not light or no sound is emitted at start up, check for loose cable connections or a bad cable. Check the vehicle battery voltage (data link 16-way connector cavity 16). A minimum of 11 volts is required to adequately power the DRBIII®. Check for proper grounds at DLC cavities 4 and 5.

If all connections are proper between the DRBIII® and the vehicle or other devices, and the vehicle battery is fully charged, an inoperative DRBIII® may be the result of faulty cable or vehicle wiring.

3.8.2 DISPLAY IS NOT VISIBLE

Low temperatures will affect the visibility of the display. Adjust the contrast to compensate for this condition.

2460403

4.0 DISCLAIMERS, SAFETY, WARNINGS

4.1 DISCLAIMERS

All information, illustrations, and specifications contained in this manual are based on the latest information available at the time of publication. The right is reserved to make changes at any time without notice.

4.2 SAFETY

4.2.1 TECHNICIAN SAFETY INFORMATION

WARNING: ENGINES PRODUCE CARBON MONOXIDE THAT IS ODORLESS, CAUSES SLOWER REACTION TIME, AND CAN LEAD TO SERIOUS INJURY. WHEN THE ENGINE IS OPERATING, KEEP SERVICE AREAS WELL VENTILATED OR ATTACH THE VEHICLE EXHAUST SYSTEM TO THE SHOP EXHAUST REMOVAL SYSTEM.

Set the parking brake and block the wheels before testing or repairing the vehicle. It is especially important to block the wheels on front-wheel drive vehicles; the parking brake does not hold the drive wheels.

When servicing a vehicle, always wear eye protection, and remove any metal jewelry such as watchbands or bracelets that might make an inadvertent electrical contact.

When diagnosing a body system problem, it is important to follow approved procedures where applicable. These procedures can be found in the

service manual. Following these procedures is very important to the safety of individuals performing diagnostic tests.

4.2.2 VEHICLE PREPARATION FOR TESTING

Make sure the vehicle being tested has a fully charged battery. If it does not, false diagnostic error messages may occur.

4.2.3 SERVICING SUB-ASSEMBLIES

Some components of the body system are intended to be serviced in assembly only. Attempting to remove or repair certain system sub-components may result in personal injury and/or improper system operation. Only those components with approved repair and installation procedures in the service manual should be serviced.

4.2.4 DRBIII® SAFETY INFORMATION

WARNING: EXCEEDING THE LIMITS OF THE DRB MULTIMETER IS DANGEROUS. IT CAN EXPOSE YOU TO SERIOUS OR POSSIBLY FATAL INJURY. CAREFULLY READ AND UNDERSTAND THE CAUTIONS AND THE SPECIFICATION LIMITS.

- Follow the vehicle manufacturer's service specifications at all times.
- Do not use the DRBIII® if it has been damaged.
- Do not use the test leads if the insulation is damaged or if metal is exposed.
- To avoid electrical shock, do not touch the test leads, tips, or the circuit being tested.
- Choose the proper range and function for the measurement. Do not try voltage or current measurements that may exceed the rated capacity.
- Do not exceed the limits shown in the table below:

FUNCTION	INPUT LIMIT
Volts	0 - 500 peak volts AC 0 - 500 volts DC
Ohms (resistance)*	0 - 1.12 megohms
Frequency Measured Frequency Generated	0 - 10 kHz
Temperature	-58 - 1100°F -50 - 600°C

- * Ohms cannot be measured if voltage is present. Ohms can be measured only in a non-powered circuit.
- Voltage between any terminal and ground must not exceed 500v DC or 500v peak AC.

- Use caution when measuring voltage above 25v DC or 25v AC.
- The circuit being tested must be protected by a 10A fuse or circuit breaker.
- Use the low current shunt to measure circuits up to 10A. Use the high current clamp to measure circuits exceeding 10A.
- When testing for the presence of voltage or current, make sure the meter is functioning correctly. Take a reading of a known voltage or current before accepting a zero reading.
- When measuring current, connect the meter in series with the load.
- Disconnect the live test lead before disconnecting the common test lead.
- When using the meter function, keep the DRBIII® away from spark plug or coil wires to avoid measuring error from outside interference.

4.3 WARNINGS

4.3.1 VEHICLE DAMAGE WARNINGS

Before disconnecting any control module, make sure the ignition is "off". Failure to do so could damage the module.

When testing voltage or continuity at any control module, use the terminal side (not the wire end) of the connector. Do not probe a wire through the insulation; will damage it and eventually cause it to fail because of corrosion.

Be careful when performing electrical tests so as to prevent accidental shorting of terminals. Such mistakes can damage fuses or components. Also, a second code could be set, making diagnosis of the original problem more difficult.

4.3.2 ROAD TESTING A COMPLAINT VEHICLE

Some complaints will require a test drive as part of the repair verification procedure. The purpose of the test drive is to try to duplicate the diagnostic code or symptom condition.

CAUTION: BEFORE ROAD TESTING A VEHICLE, BE SURE THAT ALL COMPONENTS ARE REASSEMBLED. DURING THE TEST DRIVE, DO NOT TRY TO READ THE DRB SCREEN WHILE IN MOTION. DO NOT HANG THE DRB FROM THE REAR VIEW MIRROR OR OPERATE IT YOURSELF. HAVE AN ASSISTANT AVAILABLE TO OPERATE THE DRB.

ACM STORED ENERGY PASSENGER - STORED
NO CCD COMMUNICATION - ACTIVE
SAFING SENSOR SHORT - ACTIVE
SAFING SENSOR SHORT - STORED

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be ACM ACCELEROMETER -
ACTIVE.

When Monitored and Set Condition:

ACM ACCELEROMETER - ACTIVE

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

ACM ACCELEROMETER - STORED

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

ACM INTERNAL 1 - ACTIVE

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

ACM ACCELEROMETER - ACTIVE — Continued

ACM INTERNAL 1 - STORED

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

ACM INTERNAL 2 - ACTIVE

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

ACM INTERNAL 2 - STORED

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

ACM INTERNAL 3 - ACTIVE

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

ACM INTERNAL 3 - STORED

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

ACM INTERNAL 4 - ACTIVE

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

ACM INTERNAL 4 - STORED

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

ACM OUTPUT DRIVER - ACTIVE

When Monitored: Continuously with ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

ACM OUTPUT DRIVER - STORED

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

ACM STORED ENERGY DRIVER - ACTIVE

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected an diagnostic condition, replace the module.

ACM ACCELEROMETER - ACTIVE — Continued

ACM STORED ENERGY DRIVER - STORED

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

ACM STORED ENERGY LOGIC - ACTIVE

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

ACM STORED ENERGY LOGIC - STORED

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

ACM STORED ENERGY PASSENGER - ACTIVE

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

ACM STORED ENERGY PASSENGER - STORED

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

NO CCD COMMUNICATION - ACTIVE

When Monitored: The ACM monitors the CCD Bus for ACM transmitted messages continuously with the ignition on.

Set Condition: The code will set if ACM transmitted messages are not detected on the CCD BUS for 5 consecutive seconds.

SAFING SENSOR SHORT - ACTIVE

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

SAFING SENSOR SHORT - STORED

When Monitored: Continuously with the ignition on.

Set Condition: The ACM has detected a diagnostic condition, replace the module.

Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 4 No → Repair the open or high resistance in the Driver Airbag Line 1 circuit. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>NOTE: When reconnecting airbag system components the ignition must be turned off and the battery must be disconnected.</p>	All

DRIVER SQUIB CIRCUIT OPEN - ACTIVE — Continued

TEST	ACTION	APPLICABILITY
4	<p>NOTE: Ensure that the battery is fully charged. WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. Disconnect the Clockspring connector. Disconnect the Airbag Control Module connector. NOTE: Check connectors - Clean / repair as necessary. Connect the Airbag System Load Tool # 8310 ACM Adaptor to the Airbag Control Module connector. Measure the resistance of the Driver Airbag Line 2 circuit between the ACM Adaptor and the Clockspring connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 5</p> <p>No → Repair open or high resistance in the Driver Airbag Line 2 circuit. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.</p>	All
5	<p>WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. WARNING: IF THE AIRBAG MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED. View repair.</p> <p>Repair</p> <p>Replace the Airbag Control Module in accordance with Service Instructions. WARNING: make sure the battery is disconnected and wait 2 minutes before proceeding. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.</p>	All

Symptom List:

DRIVER SQUIB CIRCUIT OPEN - STORED
DRIVER SQUIB CIRCUIT SHORT - STORED
EITHER SQUIB TERM SHORT TO BATTERY - STORED
EITHER SQUIB TERM SHORT TO GROUND - STORED
LOSS OF IGNITION RUN-START - STORED
NO CLUSTER MESSAGE - STORED
PASSENGER SQUIB CIRCUIT OPEN - STORED
PASSENGER SQUIB CIRCUIT SHORT - STORED
WARNING LAMP OPEN - SHORT - STORED

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be DRIVER SQUIB CIRCUIT OPEN
- STORED.

When Monitored and Set Condition:**DRIVER SQUIB CIRCUIT OPEN - STORED**

When Monitored: When the ignition is on, the ACM monitors the resistance of the Driver Squib circuits.

Set Condition: The ACM has detected an open circuit or high resistance in the Driver Squib circuits.

DRIVER SQUIB CIRCUIT SHORT - STORED

When Monitored: When the ignition is on, the ACM monitors the resistance of the Driver Squib circuits.

Set Condition: The ACM has detected low resistance on the Driver Squib circuits.

EITHER SQUIB TERM SHORT TO BATTERY - STORED

When Monitored: When the ignition is on, the ACM monitors the voltage of the Driver Squib circuits.

Set Condition: The ACM has detected high voltage on the Driver Squib circuits.

EITHER SQUIB TERM SHORT TO GROUND - STORED

When Monitored: When the ignition is on, the ACM monitors the voltage of the Driver Squib circuits.

Set Condition: The ACM has detected a short to ground in the Driver Squib circuits.

LOSS OF IGNITION RUN-START - STORED

When Monitored: With the ignition in the run/start position the ACM monitors the Fused Ignition Switch Output Run/Start circuit for proper system voltage.

Set Condition: If the voltage on the Fused Ignition Switch Output Run/Start circuit drops below 4.5 volts, the code will set.

DRIVER SQUIB CIRCUIT OPEN - STORED — Continued**PASSENGER SQUIB CIRCUIT OPEN - STORED**

When Monitored: With the ignition is On, the ACM monitors the resistance of the Passenger Squib circuits.

Set Condition: The ACM has detected an open circuit or high resistance on the Driver Squib circuits.

PASSENGER SQUIB CIRCUIT SHORT - STORED

When Monitored: When the ignition is on, the ACM monitors the resistance of the Passenger Squib circuits.

Set Condition: The ACM has detected low resistance in the Passenger Squib circuits.

WARNING LAMP OPEN - SHORT - STORED

When Monitored: When the ignition is On, the ACM monitors the CCD Bus for a message from the MIC containing the airbag warning lamp bulb and driver status.

Set Condition: The code is set if the lamp state is open for 2 consecutive messages or 2 seconds.

POSSIBLE CAUSES

ACTIVE OR STORED CODE PRESENT

STORED CODE OR INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure the battery is fully charged. Active codes must be resolved before diagnosing stored codes. Turn the ignition on. With the DRBIII®, record and erase all DTCs from all modules. With the DRB III monitor active codes as you work through the system. Wiggle the wiring harness and connectors of the Airbag System and rotate the steering wheel from stop to stop. NOTE: Check connectors - Clean and repair as necessary. You have just attempted to simulate the condition that initially set the trouble code message. The following additional checks may assist you in identifying a possible intermittent problem:</p> <ul style="list-style-type: none"> - Visually inspect related wire harness connectors. Look for broken, bent, pushed out, spread, corroded, or contaminated terminals. - Visually inspect the related harnesses. Look for chafed, pierced, pinched or partially broken wire. - Refer to Wiring Diagrams and Technical Service Bulletins that may apply. <p>Did the DTCs become active?</p> <p>Yes → Select appropriate active symptom from Symptom List.</p> <p>No → No problem found at this time. Erase all codes before returning vehicle to customer.</p>	All

Symptom:**DRIVER SQUIB CIRCUIT SHORT - ACTIVE****When Monitored and Set Condition:****DRIVER SQUIB CIRCUIT SHORT - ACTIVE**

When Monitored: When the ignition is on, the ACM monitors the resistance of the Driver Squib circuits.

Set Condition: The ACM has detected low resistance on the Driver Squib circuits.

POSSIBLE CAUSES

DRIVER AIRBAG MODULE LINE 1 SHORT TO LINE 2

CLOCKSPRING, DRIVER AIRBAG CIRCUITS LINE 1 SHORT TO LINE 2

DRIVER AIRBAG LINE 1 SHORT TO LINE 2

ACM, DRIVER AIRBAG CIRCUIT SHORT

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure that the battery is fully charged. WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY. Disconnect the Driver Airbag. NOTE: Check connectors - Clean and repair as necessary. Connect the Airbag System Load Tool 8310 brown cable and jumper harness to the Driver Airbag connector. Turn the ignition on, then reconnect the battery. With the DRBIII®, read the active Airbag DTCs. Does the DRB show DRIVER SQUIB CIRCUIT SHORT?</p> <p>Yes → Go To 2</p> <p>No → Replace Driver Airbag Module. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.</p>	All

DRIVER SQUIB CIRCUIT SHORT - ACTIVE — Continued

TEST	ACTION	APPLICABILITY
2	<p>NOTE: Ensure that the battery is fully charged.</p> <p>WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.</p> <p>WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.</p> <p>Disconnect the Driver Airbag.</p> <p>Disconnect the Clockspring connector.</p> <p>Note: Check connectors - Clean and repair as necessary.</p> <p>Connect the Airbag System Load Tool 8310 black cable and jumper harness to the Clockspring connector.</p> <p>Turn Ignition On, and then reconnect the Battery.</p> <p>With the DRBIII®, read the active Airbag DTCs</p> <p>Does the DRB show DRIVER SQUIB CIRCUIT SHORT?</p> <p>Yes → Go To 3</p> <p>No → Replace Clockspring.</p> <p>Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.</p>	All
3	<p>NOTE: Ensure that the battery is fully charged.</p> <p>WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.</p> <p>WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.</p> <p>Disconnect the Clockspring connector.</p> <p>Disconnect the ACM connector.</p> <p>NOTE: Check connectors - Clean and repair as necessary.</p> <p>Connect the Airbag System Load Tool 8310 ACM Adaptor to the Airbag Control Module connector.</p> <p>Measure the resistance between the Driver Airbag Line 1 and Line 2 at the Clockspring connector.</p> <p>Is the resistance below 5.0 ohms?</p> <p>Yes → Repair Driver Airbag Line 1 circuit Short to Driver Airbag Line 2 circuit.</p> <p>Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p> <p>Note: When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.</p>	All

DRIVER SQUIB CIRCUIT SHORT - ACTIVE — Continued

Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>NOTE: When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.</p>	All

Symptom:

LOSS OF IGNITION RUN ONLY - ACTIVE

When Monitored and Set Condition:

LOSS OF IGNITION RUN ONLY - ACTIVE

When Monitored: With the ignition in the run only position the ACM monitors the Fused Ignition Switch Output Run circuit for proper system voltage.

Set Condition: If the voltage on the Fused Ignition Switch Output Run Only circuit drops below 4.5 volts, the code will set.

POSSIBLE CAUSES

IGNITION SWITCH OUTPUT RUN CIRCUIT OPEN
 FUSED IGNITION SWITCH OUTPUT RUN CIRCUIT OPEN
 FUSED IGNITION SWITCH OUTPUT RUN CIRCUIT SHORT TO GROUND
 OPEN AIRBAG FUSE
 ACM, FUSED IGNITION OUTPUT RUN CIRCUIT OPEN
 ACM, FUSED IGNITION RUN CIRCUIT SHORT TO GROUND

TEST	ACTION	APPLICABILITY
1	Remove Junction Block Airbag Run circuit fuse. Note: Check connectors - Clean and repair as necessary. Turn Ignition On (Engine Off). Measure the voltage on the Ignition Switch Output Run circuit at the Junction Block Run circuit Fuse . Is the voltage above 4.5 volts? Yes → Go To 2 No → Repair the open Ignition Switch Output Run circuit. Perform AIRBAG VERIFICATION TEST - VER 1.	All
2	Turn Ignition off. Remove and inspect the Airbag Run Fuse. Is the Fuse open? Yes → Go To 3 No → Go To 5 Note: Reinstall the fuse if it is not open.	All

LOSS OF IGNITION RUN ONLY - ACTIVE — Continued

TEST	ACTION	APPLICABILITY
3	<p>Remove the Airbag Run fuse.</p> <p>WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.</p> <p>WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.</p> <p>Disconnect the Airbag Control Module connector.</p> <p>NOTE: Check connectors - Clean and repair as necessary.</p> <p>Measure the resistance of the Fused Ignition Switch Output Run circuit at the ACM connector.</p> <p>Is the resistance below 5.0 ohms ?</p> <p>Yes → Repair the Fused Ignition Switch Output Run circuit for a short to ground and replace Airbag Run Fuse. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p> <p>NOTE: When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.</p>	All
4	<p>Reconnect all previously disconnected connectors and components.</p> <p>Turn ignition off.</p> <p>Install a new Fused Ignition Switch Output Run circuit Run fuse and turn the ignition on.</p> <p>Did the Fused Ignition Switch Output Run circuit fuse blow?</p> <p>Yes → Replace the Airbag Control Module in accordance with Service Instructions. WARNING: make sure the battery is disconnected and wait 2 minutes before proceeding. Replace Airbag Run fuse. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>No → The Airbag fuse was defective and has been replaced as part of the previous test. Perform AIRBAG VERIFICATION TEST - VER 1.</p>	All
5	<p>WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.</p> <p>WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.</p> <p>Disconnect the Airbag Control Module connector.</p> <p>NOTE: Check connectors - Clean and repair as necessary.</p> <p>Turn Ignition On, then reconnect the Battery.</p> <p>Measure the voltage of the Fused Ignition Switch Output Run circuit at the Airbag Control Module connector.</p> <p>Is the voltage above 4.5 volts?</p> <p>Yes → Go To 6</p> <p>No → Repair open Fused Ignition Switch Output Run circuit. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>NOTE: When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.</p>	All

LOSS OF IGNITION RUN ONLY - ACTIVE — Continued

TEST	ACTION	APPLICABILITY
6	<p>WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.</p> <p>WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.</p> <p>View repair.</p> <p>Repair</p> <p>Replace the Airbag Control Module in accordance with Service Instructions. Symptom:**LOSS OF IGNITION RUN-START - ACTIVE****When Monitored and Set Condition:****LOSS OF IGNITION RUN-START - ACTIVE**

When Monitored: With the ignition in the Run-Start position the ACM monitors the Fused Ignition Switch Output Run-Start circuit for proper system voltage.

Set Condition: If the voltage on the Fused Ignition Switch Output Run-Start circuit drops below 4.5 volts, the code will set.

POSSIBLE CAUSES

IGNITION SWITCH RUN - START CIRCUIT

AIRBAG RUN - START FUSE TEST

FUSED IGNITION SWITCH OUTPUT RUN - START CIRCUIT SHORT TO GROUND

FUSED IGNITION SWITCH OUTPUT RUN - START CIRCUIT OPEN

ACM, FUSED IGNITION SWITCH OUTPUT RUN - START SHORT TO GROUND

ACM, FUSED IGNITION OUTPUT RUN - START CIRCUIT OPEN

TEST	ACTION	APPLICABILITY
1	Remove Airbag Run - Start Fuse. NOTE: Check connectors - Clean and repair as necessary. Turn the ignition on. Measure the voltage of the Ignition Switch Output circuit at the Airbag Run - Start Fuse. Is the voltage above 4.5 volts? Yes → Go To 2 No → Repair the open Ignition Switch Output Run - Start circuit. Perform AIRBAG VERIFICATION TEST - VER 1.	All
2	Turn Ignition off. Remove and inspect the Airbag Run - Start Fuse. Is the Fuse open? Yes → Go To 3 No → Go To 5 Note: Reinstall the fuse if it is not open.	All
3	Remove the Airbag Run - Start Fuse. Turn the ignition off. Measure the resistance of the Fused Ignition Switch Output Run/Start circuit at the Airbag Run - Start Fuse. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Replace Airbag Run - Start Fuse. Perform AIRBAG VERIFICATION TEST - VER 1.	All

LOSS OF IGNITION RUN-START - ACTIVE — Continued

TEST	ACTION	APPLICABILITY
4	<p>Warning: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.</p> <p>Disconnect the Airbag Control Module connector NOTE: Check connectors - Clean and repair as necessary. Measure the resistance of the Fused Ignition Switch Output Run - Start circuit at the Airbag Control Module connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the Fused Ignition Switch Output Run - Start circuit short to ground. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>No → Replace the Airbag Control Module in accordance with Service Instructions. WARNING: make sure the battery is disconnected and wait 2 minutes before proceeding. Replace Airbag Run - Start Fuse. Perform AIRBAG VERIFICATION TEST - VER 1.</p>	All
5	<p>WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. Is the voltage above 4.5 volts?</p> <p>Yes → Replace the Airbag Control Module in accordance with Service Instructions. WARNING: make sure the battery is disconnected and wait 2 minutes before proceeding. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>No → Repair open Fused Ignition Switch Output Run - Start circuit. Perform AIRBAG VERIFICATION TEST - VER 1.</p>	All

Symptom:
NO CCD COMMUNICATION - STORED

When Monitored and Set Condition:

NO CCD COMMUNICATION - STORED

When Monitored: The ACM monitors the CCD Bus for ACM transmitted messages continuously with the ignition on.

Set Condition: The code will set if ACM transmitted messages are not detected on the CCD BUS for 5 consecutive seconds.

POSSIBLE CAUSES

NO CCD BUS DTCS

INTERMITTENT CCD BUS TEST

TEST	ACTION	APPLICABILITY
1	Turn ignition on. NOTE: Ensure the battery is fully charged. Active codes must be resolved before diagnosing stored codes. Read both active and stored codes, and record them. With the DRBIII® monitor stored codes as you work through the system. NOTE: Check for partially seated connectors and spread terminals - Clean and repair as necessary. Wiggle the wiring harness of each module on the CCD Bus. While monitoring the DRB, road test the vehicle. Is there a wiring, connector problem, or NO CCD COMMUNICATION DTC? Yes → Repair the CCD Bus wiring, connectors or terminals as necessary. Perform AIRBAG VERIFICATION TEST - VER 1. No → No problem found at this time. Erase all codes before returning vehicle to customer. Perform AIRBAG VERIFICATION TEST - VER 1.	All

Symptom:
NO CLUSTER MESSAGE - ACTIVE

POSSIBLE CAUSES
MIC, NO CLUSTER MESSAGE - ACTIVE

TEST	ACTION	APPLICABILITY
1	<p>Note: Ensure communications with the Mechanical Instrument Cluster. With the DRB select PASSIVE RESTRAINTS, AIRBAG and MONITOR DISPLAY, WARNING LAMP STATUS. Using the DRB, read the MIC LAMP STATUS monitor. Cycle the ignition key and observe the warning lamp monitors. Does the DRBIII® show MIC LAMP STATUS: ON or OFF?</p> <p>YES Test Complete.</p> <p>NO Replace Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:**PASSENGER SQUIB CIRCUIT OPEN - ACTIVE****When Monitored and Set Condition:****PASSENGER SQUIB CIRCUIT OPEN - ACTIVE**

When Monitored: When the ignition is On, the ACM monitors the resistance of the Passenger Squib circuits.

Set Condition: The ACM has detected an open circuit or high resistance on the Passenger Squib circuits.

POSSIBLE CAUSES

PASSENGER AIRBAG OPEN

PASSENGER AIRBAG LINE 1 CIRCUIT OPEN

PASSENGER AIRBAG LINE 2 CIRCUIT OPEN

ACM, PASSENGER AIRBAG OPEN

TEST	ACTION	APPLICABILITY
1	<p>Note: Ensure the battery is fully charged. WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. CAUTION: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY. Disconnect the Passenger Airbag Module. NOTE: Check connectors - Clean and repair as necessary. Connect the Airbag System Load Tool 8310 brown cable and jumper harness to the Passenger Airbag Module connector. Turn Ignition On, then reconnect the Battery. With the DRBIII®, read the active Airbag DTCs. Does the DRB show PASSENGER SQUIB OPEN?</p> <p>Yes → Go To 2</p> <p>No → Replace Passenger Airbag. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>NOTE: When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.</p>	All

PASSENGER SQUIB CIRCUIT OPEN - ACTIVE — Continued

TEST	ACTION	APPLICABILITY
2	<p>Note: Ensure that the battery is fully charged. WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.</p> <p>Disconnect the Passenger Airbag. Disconnect the ACM connector. NOTE: Check connectors - Clean and repair as necessary. Connect the Airbag System Load Tool 8310 ACM adaptor to the Airbag Control Module connector. Measure the resistance of the Passenger Airbag Line 1 circuit between the ACM Adaptor and the Passenger Airbag connector. Is the resistance below 5.0 ohms ?</p> <p>Yes → Go To 3</p> <p>No → Repair open or high resistance in Passenger Airbag Line 1. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>Note: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.</p>	All
3	<p>Note: Ensure that the battery is fully charged. WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.</p> <p>Disconnect the Passenger Airbag. Disconnect the ACM connector. NOTE: Check connectors - Clean and repair as necessary. Connect the Airbag System Load Tool 8310 ACM adaptor to the Airbag Control Module connector. Measure the resistance of the Passenger Airbag Line 2 circuit at the ACM Adaptor and the Passenger Airbag connector and the Passenger Airbag connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 4</p> <p>No → Repair open or high resistance in Passenger Airbag Line 2 circuit. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>Note: When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.</p>	All

PASSENGER SQUIB CIRCUIT OPEN - ACTIVE — Continued

TEST	ACTION	APPLICABILITY
4	<p>WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.</p> <p>WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.</p> <p>View repair.</p> <p>Repair</p> <p>Replace the Airbag Control Module (ACM) in accordance with Service Instructions. WARNING: make sure the battery is disconnected and wait 2 minutes before proceeding.</p> <p>Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>Note: When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.</p>	All

Symptom:

PASSENGER SQUIB CIRCUIT SHORT - ACTIVE

When Monitored and Set Condition:

PASSENGER SQUIB CIRCUIT SHORT - ACTIVE

When Monitored: When the ignition is on, the ACM monitors the resistance of the Passenger Squib circuits.

Set Condition: The ACM has detected low resistance in the Passenger Squib circuits.

POSSIBLE CAUSES

PASSENGER AIRBAG MODULE SHORT

PASSENGER AIRBAG LINE 1 SHORT TO LINE 2

ACM, PASSENGER AIRBAG SHORT

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure the battery is fully charged.</p> <p>WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.</p> <p>WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.</p> <p>Disconnect the Passenger Airbag.</p> <p>NOTE: Check connectors - Clean and repair as necessary.</p> <p>Connect the Airbag System Load Tool 8310 brown cable and jumper harness to the Passenger Airbag connector.</p> <p>Turn Ignition On, then reconnect the Battery.</p> <p>With the DRBIII®, read active Airbag DTCs.</p> <p>Does the DRB show PASSENGER SQUIB CIRCUIT SHORT?</p> <p>Yes → Go To 2</p> <p>No → Replace Passenger Airbag.</p> <p>Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>Note: When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.</p>	All

PASSENGER SQUIB CIRCUIT SHORT - ACTIVE — Continued

TEST	ACTION	APPLICABILITY
2	<p>NOTE: Ensure the battery is fully charged. WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. WARNING: DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.</p> <p>Disconnect the Passenger Airbag connector. Disconnect the Airbag Control Module connector NOTE: Check connectors - Clean and repair as necessary. Connect the Airbag System Load Tool 8310 ACM adaptor to the Airbag Control Module connector. Measure the resistance between the Passenger Airbag Line 1 and Line 2 circuit at the Load Tool ACM Adaptor. Is the resistance below 5.0 Ohms?</p> <p>Yes → Repair Passenger Airbag Line 1 short to Line 2. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p> <p>NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.</p>	All
3	<p>WARNING: TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. WARNING: IF THE AIRBAG CONTROL MODULE IS DROPPED AT ANY TIME, IT MUST BE REPLACED.</p> <p>View repair.</p> <p>Repair</p> <p>Replace the Airbag Control Module in accordance with Service Instructions. Symptom:

WARNING LAMP OPEN - SHORT - ACTIVE

When Monitored and Set Condition:

WARNING LAMP OPEN - SHORT - ACTIVE

When Monitored: With ignition On, or the ACM needs to turn the lamp on because of detection of a code, or during a lamp check.

Set Condition: With voltage and current on, the airbag warning lamp driver circuit is other than expected.

POSSIBLE CAUSES

MIC DRIVER STATUS

INSPECT AIRBAG LAMP

ACM, AIRBAG INDICATOR OPEN/SHORT

ACM, INDICATOR DRIVER SHORT

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII® select PASSIVE RESTRAINTS, AIRBAG, MONITOR DISPLAY and WARNING LAMP STATUS. With the DRBIII®, read the MIC BULB STATE monitor. Does the DRB show MIC BULB STATE: OK ?</p> <p>YES Go To 2</p> <p>NO Go To 3</p>	All
2	<p>With the DRBIII® select PASSIVE RESTRAINTS, AIRBAG and MONITOR DISPLAY, WARNING LAMP STATUS. With the DRBIII®, read the MIC DRIVER STATE monitor. Does the DRBIII® show MIC DRIVER STATE: OK ?</p> <p>YES Replace the Airbag Control Module in accordance with Service Instructions. WARNING: make sure the battery is disconnected and wait 2 minutes before proceeding. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>NO Replace the Instrument Cluster. Perform AIRBAG VERIFICATION TEST - VER 1.</p>	All

WARNING LAMP OPEN - SHORT - ACTIVE — Continued

TEST	ACTION	APPLICABILITY
3	Remove and inspect the airbag indicator bulb from the Instrument Cluster. Is the airbag bulb open? YES Replace the Airbag indicator bulb. Perform BODY VERIFICATION TEST - VER 1. NO Replace the Airbag Control Module in accordance with Service Instructions. WARNING: make sure the battery is disconnected and wait 2 minutes before proceeding. Perform AIRBAG VERIFICATION TEST - VER 1.	All

Symptom:

*AIRBAG INDICATOR ON WITHOUT ACTIVE TROUBLE CODES

POSSIBLE CAUSES

INSTRUMENT CLUSTER PROBLEMS

AIRBAG INDICATOR ON WITHOUT TROUBLE CODES

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. With the DRBIII® select MONITOR DISPLAY, WARNING LAMP STATUS and read the PASSIVE RESTRAINTS, AIRBAG, MONITOR DISPLAY, PASSIVE RESTRAINTS, AIRBAG, MONITOR DISPLAY, WARNING LAMP STATUS. With no active DTCs, Does the ACM LAMP REQ: display ON?</p> <p>Yes → Replace the Airbag Control Module in accordance with Service Instructions. WARNING: make sure the battery is disconnected and wait 2 minutes before proceeding. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>No → Refer to symptom list for problems related to Instrument Cluster. Perform AIRBAG VERIFICATION TEST - VER 1.</p> <p>NOTE: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.</p>	All

Symptom:
***BUS (+) AND BUS (-) OPEN**
POSSIBLE CAUSES

DRB OR DRB CABLE

CCD BUS (+) OR BUS (-) CIRCUIT OPEN

INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	<p>Ignition on, engine not running. Disconnect the DRB from the Data Link Connector (DLC). Measure the voltage of the CCD Bus (+) and the CCD Bus (-) circuits in the DLC. Is the voltage between 1.8 and 2.8 volts on both circuits?</p> <p>Yes → Repair/Replace the DRB or DRB cable as necessary. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition off. Remove the Instrument Cluster. Measure the resistance of the CCD Bus (+) and the CCD Bus (-) circuits between the Instrument Cluster C2 harness connector and the DLC. Is the resistance below 5.0 ohms on both circuits?</p> <p>Yes → Go To 3</p> <p>No → Repair the CCD Bus (+) or CCD Bus (-) circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:

*BUS (+) AND BUS (-) SHORTED TOGETHER

POSSIBLE CAUSES
BUS SYSTEM MODULE/COMPONENT INTERNALLY SHORTED
BUS (+) AND BUS (-) CIRCUITS SHORTED TOGETHER
DRB/DRB CABLE BUS (+) AND BUS (-) SHORTED TOGETHER

TEST	ACTION	APPLICABILITY
1	<p>Ensure the ignition key is off while disconnecting the following Modules. Disconnect the following Components (if equipped) one at a time in an orderly manner (be sure to turn the ignition off before disconnecting any Module). After disconnecting, turn the ignition back on. Observe the DRB Bus Test message for a change after each Module is disconnected which will identify that module as being the cause of the original Bus Failure Message. Disconnect the PCM C3 harness connector. Disconnect the TCM harness connector. Disconnect the SKIM harness connector. Disconnect the RKE Module harness connector. Disconnect the Overhead Console harness connector. Disconnect the Instrument Cluster C2 harness connector. TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. Disconnect the ACM harness connector. TURN IGNITION ON, THEN RECONNECT THE BATTERY. Did the DRB display a different bus message after disconnecting any one module/component?</p> <p>Yes → Replace the Module/Component causing the BUS FAILURE MESSAGE. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>All modules must be disconnected from the CCD Bus circuit at this time. Measure the resistance between the CCD Bus (+) circuit and the CCD Bus (-) circuit at the Data Link connector. Is the resistance below 100.0 ohms?</p> <p>Yes → Repair the CCD Bus (+) circuit for a short to the CCD Bus (-) circuit. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>If there are no possible causes remaining, view repair.</p> <p>Repair Repair/Replace the DRB or DRB cable as necessary. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:

***BUS (+) OPEN OR BUS (-) OPEN**

POSSIBLE CAUSES
DRB OR DRB CABLE
CCD BUS (+) OR BUS (-) CIRCUIT OPEN
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	<p>Ignition on, engine not running. Disconnect the DRB from the Data Link Connector (DLC). Measure the voltage of the CCD Bus (+) and the CCD Bus (-) circuits in the DLC. Is the voltage between 1.8 and 2.8 volts on both circuits?</p> <p>Yes → Repair/Replace the DRB or DRB cable as necessary. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition off. Remove the Instrument Cluster. Measure the resistance of the CCD Bus (+) and the CCD Bus (-) circuits between the Instrument Cluster C2 harness connector and the DLC. Is the resistance below 5.0 ohms on both circuits?</p> <p>Yes → Go To 3</p> <p>No → Repair the CCD Bus (+) or CCD Bus (-) circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:

***BUS BIAS LEVEL TOO HIGH**

POSSIBLE CAUSES
DRB OR DRB CABLE
POWERTRAIN CONTROL MODULE
AIRBAG CONTROL MODULE
SENTRY KEY IMMOBILIZER MODULE (IF EQUIPPED)
REMOTE KEYLESS ENTRY MODULE (IF EQUIPPED)
OVERHEAD CONSOLE (IF EQUIPPED)
TRANSMISSION CONTROL MODULE (IF EQUIPPED)
GROUND CIRCUIT OPEN
CCD BUS (+) OR BUS (-) CIRCUIT OPEN
CCD BUS (+) OR BUS (-) CIRCUIT SHORTED TO GROUND
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	<p>Ignition on, engine not running. Disconnect the DRB from the Data Link Connector (DLC). Measure the voltage of the CCD Bus (+) and the CCD Bus (-) circuits in the DLC. Is the voltage between 1.8 and 2.8 volts on both circuits?</p> <p>Yes → Repair/Replace the DRB or DRB cable as necessary. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition off. Disconnect the PCM C3 harness connector. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: BUS OPERATIONAL?</p> <p>Yes → Replace the Powertrain Control Module. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 3</p>	All
3	<p>TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. Disconnect the ACM harness connector. TURN THE IGNITION ON, THEN RECONNECT THE BATTERY. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: BUS OPERATIONAL?</p> <p>Yes → Replace the Airbag Control Module. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All

***BUS BIAS LEVEL TOO HIGH — Continued**

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the SKIM harness connector. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: BUS OPERATIONAL?</p> <p>Yes → Replace the Sentry Key Immobilizer Module. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the RKE Module harness connector. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: BUS OPERATIONAL?</p> <p>Yes → Replace the Remote Keyless Entry Module. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off. Disconnect the Compass Mini Trip Computer (overhead console) harness connector. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: BUS OPERATIONAL?</p> <p>Yes → Replace the Compass Mini Trip Computer (Overhead Console). Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All
7	<p>Turn the ignition off. Disconnect the TCM harness connector. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: BUS OPERATIONAL?</p> <p>Yes → Replace the Transmission Control Module. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 8</p>	All
8	<p>Turn the ignition off. Disconnect the Instrument Cluster C1 harness connector. NOTE: Ensure the interior lights are off. Measure the resistance between ground and the ground circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 9</p> <p>No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All

*BUS BIAS LEVEL TOO HIGH — Continued

TEST	ACTION	APPLICABILITY
9	<p>Turn the ignition off. Remove the Instrument Cluster. Measure the resistance of the CCD Bus (+) and the CCD Bus (-) circuits between the Instrument Cluster C2 harness connector and the DLC. Is the resistance below 5.0 ohms on both circuits?</p> <p>Yes → Go To 10</p> <p>No → Repair the CCD Bus (+) or CCD Bus (-) circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
10	<p>Turn the ignition off. Disconnect the negative battery cable. Remove the Instrument Cluster. Measure the resistance between ground and the CCD Bus (+) and the CCD Bus (-) circuits. Is the resistance below 1000.0 ohms on either circuit?</p> <p>Yes → Repair the CCD Bus (+) or CCD Bus (-) circuit for a short to ground. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 11</p>	All
11	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:
***NO RESPONSE FROM CONTROLLER ANTILOCK BRAKE**
POSSIBLE CAUSES

ATTEMPT TO COMMUNICATE WITH THE PCM
 CHECK FUSE #25 IN JUNCTION BLOCK
 OPEN GROUND CIRCUITS
 OPEN FUSED IGNITION SWITCH OUTPUT CIRCUIT
 SCI TRANSMIT CIRCUIT OPEN
 CONTROLLER ANTILOCK BRAKE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB attempt to communicate with the PCM. Was the DRB able to communicate with the PCM? Yes → Go To 2 No → Refer to symptom list for problems related to No Response From PCM. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Remove and inspect fuse #25 in the Junction Block. Is the fuse open? Yes → Refer to the wiring diagrams located in the service information to help isolate a possible short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the CAB harness connector. Measure the resistance between ground and each ground circuit (cavs 8 and 24). Is the resistance below 5.0 ohms for each measurement? Yes → Go To 4 No → Repair the ground circuit that measured above 5.0 ohms for an open. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. NOTE: Ensure fuse #25 is installed in the Junction Block. Disconnect the CAB harness connector. Turn the ignition on. Measure the voltage of the Fused Ignition Switch Output circuit. Is the voltage above 10.0 volts? Yes → Go To 5 No → Repair the Fused Ignition Switch Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

***NO RESPONSE FROM CONTROLLER ANTILOCK BRAKE — Continued**

TEST	ACTION	APPLICABILITY
5	Turn the ignition off. Disconnect the CAB harness connector. Measure the resistance of the SCI Transmit circuit between the CAB connector and the DLC. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the SCI Transmit circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Controller Antilock Brake. Perform BODY VERIFICATION TEST - VER 1.	All

Symptom:

***NO RESPONSE FROM INSTRUMENT CLUSTER**

POSSIBLE CAUSES
GROUND CIRCUIT OPEN
CCD BUS (+) CIRCUIT OPEN
CCD BUS (-) CIRCUIT OPEN
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure the DRB can establish communications with the PCM before beginning. Turn the ignition off. Disconnect the Instrument Cluster C2 harness connector. Measure the resistance between ground and the ground circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 2</p> <p>No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>NOTE: Ensure the DRB can establish communications with the PCM before beginning. Turn the ignition off. Disconnect the Instrument Cluster C2 harness connector. Connect a jumper wire between the CCD Bus (+) circuit and ground. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: SHORT TO GROUND?</p> <p>Yes → Go To 3</p> <p>No → Repair the CCD Bus (+) circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>NOTE: Ensure the DRB can establish communications with the PCM before beginning. Turn the ignition off. Disconnect the Instrument Cluster C2 harness connector. Connect a jumper wire between the CCD Bus (-) circuit and ground. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. 4	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:

***NO RESPONSE FROM PCM-ENGINE STARTS (GAS ONLY)**

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH ANOTHER VEHICLE
CHECK PCM POWERS AND GROUNDS
TRANSMISSION CONTROL MODULE
CONTROLLER ANTILOCK BRAKE
SCI TRANSMIT CIRCUIT SHORTED TO GROUND
SCI RECEIVE CIRCUIT SHORTED TO GROUND
SCI RECEIVE CIRCUIT OPEN
SCI TRANSMIT CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. NOTE: Make sure the vehicle starts and runs before proceeding, if not refer to the appropriate symptom for a no response and a no start condition. Connect the DRB to another vehicle. Will the DRB communicate with this vehicle? Yes → Go To 2 No → Repair or replace the DRB or DRB cable as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
2	Perform the symptom Checking PCM Power and Ground Circuits in the Driveability category. Did the vehicle pass this test? Yes → Go To 3 No → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
3	Turn the ignition off. Disconnect the PCM C3 harness connector. Disconnect the DRB from the DLC. Measure the resistance between ground and the SCI Transmit circuit. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Go To 6	All
4	Turn the ignition off. Disconnect the TCM harness connector (if equipped). Measure the resistance between ground and the SCI Transmit circuit. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Replace the Transmission Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

***NO RESPONSE FROM PCM-ENGINE STARTS (GAS ONLY) — Continued**

TEST	ACTION	APPLICABILITY
5	<p>Turn the ignition off. Disconnect the CAB harness connector (if equipped). Measure the resistance between ground and the SCI Transmit circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the SCI Transmit circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Replace the Controller Antilock Brake. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
6	<p>Turn the ignition off. Disconnect the PCM C3 harness connector. Disconnect the DRB from the DLC. Measure the resistance between ground and the SCI Receive circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the SCI Receive circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Go To 7</p>	All
7	<p>Turn the ignition off. Disconnect the PCM C3 harness connector. Disconnect the DRB from the DLC. Measure the resistance of the SCI Receive circuit between the PCM C3 connector and the DLC. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 8</p> <p>No → Repair the SCI Receive circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
8	<p>Turn the ignition off. Disconnect the PCM C3 harness connector. Disconnect the DRB from the DLC. Measure the resistance of the SCI Transmit circuit between the PCM C3 connector and the DLC. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 9</p> <p>No → Repair the SCI Transmit circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
9	<p>NOTE: Ensure the SCI Transmit and Receive circuits are not shorted to voltage, damage to the PCM may result. If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Powertrain Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All

Symptom:

***NO RESPONSE FROM REMOTE KEYLESS ENTRY MODULE**

POSSIBLE CAUSES
<p>FUSED B+ OPEN</p> <p>GROUND CIRCUIT OPEN</p> <p>CCD BUS (+) CIRCUIT OPEN</p> <p>CCD BUS (-) CIRCUIT OPEN</p> <p>RKE MODULE - OPEN COMMUNICATION</p>

TEST	ACTION	APPLICABILITY
1	<p>Disconnect the RKE module harness connector.</p> <p>Measure the voltage of the Fused B(+) circuit.</p> <p>Is the voltage above 10.0 volts?</p> <p>Yes → Go To 2</p> <p>No → Repair the Fused B(+) circuit for an open.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All
2	<p>Turn the ignition off.</p> <p>Disconnect the RKE module harness connector.</p> <p>Turn all lights off.</p> <p>Measure the resistance between ground and the Ground circuit in the RKE Module connector.</p> <p>Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 3</p> <p>No → Repair the Ground circuit for an open.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All
3	<p>Turn the ignition off.</p> <p>Disconnect the RKE module harness connector.</p> <p>Connect a jumper wire between the CCD Bus (+) circuit and ground.</p> <p>Turn the ignition on.</p> <p>With the DRB, enter SYSTEM MONITORS then CCD Bus Test.</p> <p>Does the DRB display: SHORT TO GROUND?</p> <p>Yes → Go To 4</p> <p>No → Repair the CCD Bus (+) circuit for an open.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All
4	<p>Turn the ignition off.</p> <p>Disconnect the RKE module harness connector.</p> <p>Connect a jumper wire between the CCD Bus (-) circuit and ground.</p> <p>Turn the ignition on.</p> <p>With the DRB, enter SYSTEM MONITORS then CCD Bus Test.</p> <p>Does the DRB display: SHORT TO GROUND?</p> <p>Yes → Go To 5</p> <p>No → Repair the CCD Bus (-) circuit for an open.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All

***NO RESPONSE FROM REMOTE KEYLESS ENTRY MODULE — Continued**

TEST	ACTION	APPLICABILITY
5	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Remote Keyless Entry Module.</p> <p>Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:

***NO RESPONSE FROM SENTRY KEY IMMOBILIZER MODULE**

POSSIBLE CAUSES
REPLACE PDC FUSE
FUSED B+ CIRCUIT SHORTED TO GROUND
SKIM - FUSED B+ CIRCUIT SHORTED TO GROUND
FUSED B+ CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
GROUND CIRCUIT OPEN
CCD BUS (+) CIRCUIT OPEN
CCD BUS (-) CIRCUIT OPEN
SENTRY KEY IMMOBILIZER MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Remove and inspect fuse #27 in the PDC. Is the fuse open? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition off. Replace fuse #27 in the PDC. Turn the ignition on. Turn the ignition off and inspect fuse #27 in the PDC. Is the fuse open? Yes → Go To 3 No → Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short to ground. Perform SKIS VERIFICATION.	All
3	Turn the ignition off. Disconnect the SKIM harness connector. Measure the resistance between ground and the Fused B+ circuit. Is the resistance below 5.0 ohms? Yes → Repair the Fused B+ circuit for a short to ground. Perform SKIS VERIFICATION. No → Replace the Sentry Key Immobilizer Module. Perform SKIS VERIFICATION.	All

***NO RESPONSE FROM SENTRY KEY IMMOBILIZER MODULE — Continued**

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. NOTE: Ensure fuse #27 is installed in the PDC. Disconnect the SKIM harness connector. Measure the voltage of the Fused B+ circuit. Is the voltage above 10.0 volts?</p> <p>Yes → Go To 5</p> <p>No → Repair the Fused B(+) circuit for an open. Perform SKIS VERIFICATION.</p>	All
5	<p>Turn the ignition off. Disconnect the SKIM harness connector. Turn the ignition on. Measure the voltage of the Fused Ignition Switch Output circuit. Is the voltage above 10.0 volts?</p> <p>Yes → Go To 6</p> <p>No → Repair the Fused Ignition Switch Output circuit for an open. Perform SKIS VERIFICATION.</p>	All
6	<p>Turn the ignition off. Disconnect the SKIM harness connector. Turn all lights off. Measure the resistance between ground and both Ground circuits in the SKIM connector. Is the resistance below 5.0 ohms for each measurement?</p> <p>Yes → Go To 7</p> <p>No → Repair the Ground circuit for an open. Perform SKIS VERIFICATION.</p>	All
7	<p>Turn the ignition off. Disconnect the SKIM harness connector. Connect a jumper wire between the CCD Bus (+) circuit and ground. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: SHORT TO GROUND?</p> <p>Yes → Go To 8</p> <p>No → Repair the CCD Bus (+) circuit for an open. Perform SKIS VERIFICATION.</p>	All
8	<p>Turn the ignition off. Disconnect the SKIM harness connector. Connect a jumper wire between the CCD Bus (-) circuit and ground. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: SHORT TO GROUND?</p> <p>Yes → Go To 9</p> <p>No → Repair the CCD Bus (-) circuit for an open. Perform SKIS VERIFICATION.</p>	All
9	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Sentry Key Immobilizer Module. Perform SKIS VERIFICATION.</p>	All

Symptom:

***NO RESPONSE FROM TRANSMISSION CONTROL MODULE**

POSSIBLE CAUSES
GROUND CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
CCD BUS (+) CIRCUIT OPEN
CCD BUS (-) CIRCUIT OPEN
TRANSMISSION CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure the DRB can establish communications with the PCM before beginning. Turn the ignition off. Disconnect the TCM harness connector. Measure the resistance between ground and the ground circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 2</p> <p>No → Repair the Ground circuit for an open. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All
2	<p>NOTE: Ensure the DRB can establish communications with the PCM before beginning. Turn the ignition off. Disconnect the TCM harness connector. Turn the ignition on. Measure the voltage of the Fused Ignition Switch Output circuit. Is the voltage above 10.0 volts?</p> <p>Yes → Go To 3</p> <p>No → Repair the Fused Ignition Switch Output circuit for an open. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All
3	<p>NOTE: Ensure the DRB can establish communications with the PCM before beginning. Turn the ignition off. Disconnect the TCM harness connector. Connect a jumper wire between the CCD Bus (+) circuit and ground. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: SHORT TO GROUND?</p> <p>Yes → Go To 4</p> <p>No → Repair the CCD Bus (+) circuit for an open. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All

***NO RESPONSE FROM TRANSMISSION CONTROL MODULE — Continued**

TEST	ACTION	APPLICABILITY
4	<p>NOTE: Ensure the DRB can establish communications with the PCM before beginning.</p> <p>Turn the ignition off. Disconnect the TCM harness connector. Connect a jumper wire between the CCD Bus (-) circuit and ground. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: SHORT TO GROUND?</p> <p>Yes → Go To 5</p> <p>No → Repair the CCD Bus (-) circuit for an open. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All
5	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Transmission Control Module. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All

Symptom:

***NO TERMINATION FAILURE**

POSSIBLE CAUSES
CCD BUS (+) CIRCUIT OPEN
CCD BUS (-) CIRCUIT OPEN
PCM AND INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition off. Disconnect the PCM C3 harness connector. Connect a jumper wire between the CCD Bus (+) circuit and ground. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: SHORT TO GROUND?</p> <p>Yes → Go To 2</p> <p>No → Repair the CCD Bus (+) circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p>	All
2	<p>Turn the ignition off. Disconnect the PCM C3 harness connector. Connect a jumper wire between the CCD Bus (-) circuit and ground. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: SHORT TO GROUND?</p> <p>Yes → Go To 3</p> <p>No → Repair the CCD Bus (-) circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p>	All
3	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>If there are no possible causes remaining, replace the PCM and the Instrument Cluster. Note: For this Bus Failure Message to appear both Instrument Cluster and Powertrain Control Modules would have to be open. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p>	All

Symptom:
***NOT RECEIVING BUS MESSAGES CORRECTLY**
POSSIBLE CAUSES

POWERTRAIN CONTROL MODULE
 AIRBAG CONTROL MODULE
 SENTRY KEY IMMOBILIZER MODULE (IF EQUIPPED)
 REMOTE KEYLESS ENTRY MODULE (IF EQUIPPED)
 OVERHEAD CONSOLE (IF EQUIPPED)
 TRANSMISSION CONTROL MODULE (IF EQUIPPED)
 DRB OR DRB CABLE
 INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the PCM C3 harness connector. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: BUS OPERATIONAL? Yes → Replace the Powertrain Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 2	All
2	TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. Disconnect the ACM harness connector. TURN THE IGNITION ON, THEN RECONNECT THE BATTERY. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: BUS OPERATIONAL? Yes → Replace the Airbag Control Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the SKIM harness connector. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: BUS OPERATIONAL? Yes → Replace the Sentry Key Immobilizer Module. Perform BODY VERIFICATION TEST - VER 1. No → Go To 4	All

*NOT RECEIVING BUS MESSAGES CORRECTLY — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the RKE Module harness connector. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: BUS OPERATIONAL?</p> <p>Yes → Replace the Remote Keyless Entry Module. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the Compass Mini Trip Computer (overhead console) harness connector. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: BUS OPERATIONAL?</p> <p>Yes → Replace the Compass Mini Trip Computer (Overhead Console). Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off. Disconnect the TCM harness connector. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: BUS OPERATIONAL?</p> <p>Yes → Replace the Transmission Control Module. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All
7	<p>Try another DRB and Cable. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB still display: NOT RECEIVING BUS MESSAGES CORRECTLY?</p> <p>Yes → Replace the Instrument Cluster. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair/replace the DRB or DRB cable as necessary. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:

***SHORT TO 5 VOLTS FAILURE**

POSSIBLE CAUSES	
CONTINUITY BETWEEN BUS(+) OR (-) AND 5 VOLT SUPPLY CIRCUITS	
POWERTRAIN CONTROL MODULE	
BUS (+) OR BUS (-) CIRCUIT SHORTED TO VOLTAGE	
DRB OR DRB CABLE	
MODULE/COMPONENT SHORTED INTERNALLY	
CCD BUS CIRCUIT SHORTED TO A 5 VOLT CIRCUIT	

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the PCM C3 harness connector. Turn the ignition on. Does the DRB display: BUS OPERATIONAL after disconnecting the PCM? Yes → Go To 2 No → Go To 3	All
2	Turn the ignition off. Disconnect the PCM harness connectors. Measure the resistance between the CCD Bus (+) circuit and the 5 volt supply circuits at the PCM connectors. Measure the resistance between the CCD Bus (-) circuit and the 5 volt supply circuits at the PCM connectors. Was the resistance below 800.0 ohms on either of the CCD Bus circuits to any 5 volt supply circuit? Yes → Repair the CCD Bus (+) or the CCD Bus (-) circuit for a short to a 5 volt supply circuit. Perform BODY VERIFICATION TEST - VER 1. No → Replace the Powertrain Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

*SHORT TO 5 VOLTS FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	<p>Ensure the ignition key is off while disconnecting the following Modules. Disconnect the following Components from the CCD Bus one at a time in an orderly manner (be sure to turn the ignition off before disconnecting any Module). After disconnecting, turn the ignition back on. Observe the DRB Bus message for a change after each Module is disconnected which will identify that module/circuits as being the cause of the Bus Failure Message. Disconnect the TCM harness connector if equipped. Disconnect the Overhead Console harness connector if equipped. Remove the Instrument Cluster from the Instrument Panel. Disconnect the RKE Module harness connector if equipped. Disconnect the SKIM harness connector if equipped. TURN IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. Disconnect the ACM harness connector. TURN IGNITION ON, THEN RECONNECT THE BATTERY. Did the DRB Bus message change after disconnecting any one module/component?</p> <p>Yes → Go To 4 No → Go To 5</p>	All
4	<p>Turn the ignition off. Disconnect the harness connectors on the module that when disconnected the bus failure message was eliminated. Measure the resistance between the CCD Bus (+) circuit and each 5 volt circuit in the harness connector. Measure the resistance between the CCD Bus (-) circuit and each 5 volt circuit in the harness connector. Is the resistance below 100.0 ohms on any of the measurements?</p> <p>Yes → Repair the CCD Bus circuit for a short to a 5 volt circuit. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Replace the module/component that caused the bus failure message. Perform BODY VERIFICATION TEST - VER 1.</p>	All
5	<p>All modules must be disconnected from the CCD Bus circuit at this time. Turn the ignition on. Measure the CCD Bus (+) circuit and the CCD Bus (-) circuit at the Data Link connector for voltage. Is the voltage above 4.0 volts on either Bus circuit?</p> <p>Yes → Repair the CCD Bus (+) or the CCD Bus (-) circuit for a short to voltage. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Go To 6</p>	All
6	<p>If there are no possible causes remaining, view repair.</p> <p>Repair Repair/Replace the DRB or DRB cable as necessary. Perform BODY VERIFICATION TEST - VER 1.</p>	All

Symptom:
***SHORT TO BATTERY FAILURE**

POSSIBLE CAUSES	
POWERTRAIN CONTROL MODULE OPEN GROUND CIRCUITS	
POWERTRAIN CONTROL MODULE - INTERNAL SHORT TO BATTERY	
AIRBAG CONTROL MODULE	
INSTRUMENT CLUSTER GROUND CIRCUIT OPEN	
INSTRUMENT CLUSTER - INTERNAL SHORT TO BATTERY	
SENTRY KEY IMMOBILIZER MODULE (IF EQUIPPED)	
SENTRY KEY IMMOBILIZER MODULE GROUND CIRCUIT OPEN	
SENTRY KEY IMMOBILIZER MODULE - INTERNAL SHORT TO BATTERY	
REMOTE KEYLESS ENTRY MODULE GROUND CIRCUIT OPEN	
REMOTE KEYLESS ENTRY MODULE - INTERNAL SHORT TO BATTERY	
OVERHEAD CONSOLE GROUND CIRCUIT OPEN	
OVERHEAD CONSOLE - INTERNAL SHORT TO BATTERY	
TRANSMISSION CONTROL MODULE (IF EQUIPPED)	
CCD BUS (+) OR BUS (-) CIRCUIT SHORTED TO BATTERY	
DRB OR DRB CABLE	

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the PCM C3 harness connector. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: SHORT TO BATTERY? Yes → Go To 2 No → Go To 13	All
2	TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING. Disconnect the ACM harness connector. TURN THE IGNITION ON, THEN RECONNECT THE BATTERY. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: SHORT TO BATTERY? Yes → Go To 3 No → Replace the Airbag Control Module. Perform BODY VERIFICATION TEST - VER 1.	All

***SHORT TO BATTERY FAILURE — Continued**

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Instrument Cluster C2 harness connector. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: SHORT TO BATTERY?</p> <p>Yes → Go To 4 No → Go To 12</p>	All
4	<p>NOTE: Answer Yes to the question if the vehicle is not equipped with this module. Turn the ignition off. Disconnect the SKIM harness connector. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: SHORT TO BATTERY?</p> <p>Yes → Go To 5 No → Go To 11</p>	All
5	<p>NOTE: Answer Yes to the question if the vehicle is not equipped with this module. Turn the ignition off. Disconnect the RKE Module harness connector. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: SHORT TO BATTERY?</p> <p>Yes → Go To 6 No → Go To 10</p>	All
6	<p>NOTE: Answer Yes to the question if the vehicle is not equipped with this module. Turn the ignition off. Disconnect the Overhead Console harness connector. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: SHORT TO BATTERY?</p> <p>Yes → Go To 7 No → Go To 9</p>	All
7	<p>NOTE: Answer Yes to the question if the vehicle is not equipped with this module. Turn the ignition off. Disconnect the TCM harness connector. Turn the ignition on. With the DRB, enter SYSTEM MONITORS then CCD Bus Test. Does the DRB display: SHORT TO BATTERY?</p> <p>Yes → Go To 8 No → Replace the Transmission Control Module. Perform BODY VERIFICATION TEST - VER 1.</p>	All

***SHORT TO BATTERY FAILURE — Continued**

TEST	ACTION	APPLICABILITY
8	<p>Turn the ignition off. Disconnect the PCM C3 harness connector. Disconnect the ACM harness connector. Disconnect the Instrument Cluster C2 harness connector. Disconnect the SKIM harness connector (If equipped). Disconnect the RKE Module harness connector (If equipped). Disconnect the Overhead Console harness connector (If equipped). Disconnect the TCM harness connector (If equipped). Turn the ignition on. Measure the voltage of the CCD Bus (+) and the CCD Bus (-) circuits at the DLC. Is the voltage above 0.5 volts?</p> <p>Yes → Repair the CCD Bus (+) or CCD Bus (-) circuit for a short to battery. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair/replace the DRB or DRB cable as necessary. Perform BODY VERIFICATION TEST - VER 1.</p>	All
9	<p>Turn the ignition off. Disconnect the Overhead Console harness connector. Turn all lights off. Measure the resistance between ground and the Ground circuit (cavity 12). Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Compass Mini Trip Computer (Overhead Console). Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
10	<p>Turn the ignition off. Disconnect the RKE module harness connector. Turn all lights off. Measure the resistance between ground and the Ground circuit in the RKE Module connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Remote Keyless Entry Module. Perform BODY VERIFICATION TEST - VER 1.</p> <p>No → Repair the Ground circuit for an open. Perform BODY VERIFICATION TEST - VER 1.</p>	All
11	<p>Turn the ignition off. Disconnect the SKIM harness connector. Turn all lights off. Measure the resistance between ground and both Ground circuits in the SKIM connector. Is the resistance below 5.0 ohms for each measurement?</p> <p>Yes → Replace the Sentry Key Immobilizer Module. 6	Disconnect the RKE module connector. Momentarily connect a jumper wire between the RKE Door Lock Control circuit in the RKE module connector and ground. Did the door lock motors actuate? Yes → Go To 7 No → Go To 8	All
7	If there are no possible causes remaining, view repair. Repair Replace the Remote Keyless Entry Module. Perform BODY VERIFICATION TEST - VER 1.	All
8	Disconnect the RKE module connector. Remove the Passenger Door panel to gain access to the Passenger Door Module. Disconnect the Passenger Door Module C2 connector. Measure the resistance of the RKE Door Unlock Control circuit between the Passenger Door Module C2 connector and the RKE Module connector. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the RKE Door Unlock Control wire for an open. Perform BODY VERIFICATION TEST - VER 1.	All
9	Disconnect the RKE module connector. Remove the Passenger Door panel to gain access to the Passenger Door Module. Disconnect the Passenger Door Module C2 connector. Measure the resistance of the RKE Door Lock Control circuit between the Passenger Door Module C2 connector and the RKE Module connector. Is the resistance below 5.0 ohms? Yes → Go To 10 No → Repair the RKE Door Lock Control wire for an open. Perform BODY VERIFICATION TEST - VER 1.	All
10	If there are no possible causes remaining, view repair. Repair Replace the Passenger Door Module. Perform BODY VERIFICATION TEST - VER 1.	All

Verification Tests

AIRBAG VERIFICATION TEST - VER 1	APPLICABILITY
<ol style="list-style-type: none"> 1. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery. 2. Turn the Ignition key On and reconnect the Battery. 3. Connect the DRB to the Data Link Connector - use the most current software available. 4. Use the DRB III and erase the stored codes. 5. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On. 6. Wait one minute, and read active codes and if there are none present read the stored codes. 7. Note: If equipped with Passenger Airbag On/Off switch, read the DTC's in both switch positions. 8. If the DRB shows any active or stored codes, return to the Symptom list and follow path specified for that trouble code. If no active or stored codes are present, the repair is complete. <p>Are any codes present?</p> <p>YES</p> <p>Select the appropriate system from the category List and continue diagnostics.</p> <p>NO</p> <p>Repair is complete.</p>	All

AW4 TRANS VERIFICATION TEST-VER1	APPLICABILITY
<ol style="list-style-type: none"> 1. Connect the DRBIII® to the Data Link Connector (DLC). 2. Reconnect any disconnected components. 3. With the DRBIII®, erase all Transmission DTC's, also erase the PCM DTC's. 4. Check the transmission fluid and adjust if necessary. Refer to the Service Information for the Fluid Fill procedure. 5. Road test the vehicle. With the DRBIII®, monitor the engine RPM. Make 15 to 20 1-2, 2-3, 3-4 upshifts. Perform these shifts from a standing start to 45 MPH with a constant throttle opening of 20 to 25 degrees. 6. Below 25 MPH, make 5 to 8 wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown. 7. Attempt to reset the specific DTC, drive the vehicle to the When Monitored/When Set conditions for the DTC to verify the DTC is repaired.. 8. Check for Diagnostic Trouble Codes (DTC's) during the road test. If a DTC sets during the road test, return to the Symptom list and perform the diagnostics. 9. NOTE: Erase P0700 DTC in the PCM after making transmission repairs. This will turn the MIL off. <p>Were any DTC's set during the road test?</p> <p>Yes refer to the symptom list</p> <p>Repair is not complete, refer to appropriate symptom.</p> <p>No Test Complete</p> <p>Repair is complete.</p>	All

Verification Tests — Continued

BODY VERIFICATION TEST - VER 1	APPLICABILITY
<ol style="list-style-type: none"> 1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors. 2. If the Sentry Key Immobilizer Module (SKIM) or the Powertrain Control Module (PCM) were replaced, proceed to number 4. If the SKIM or PCM were not replaced, continue to the next number. 3. If the Remote Keyless Entry module was replaced, using the DRBIII® select "Theft Alarm" "VTSS" "Miscellaneous" and "Program RKE". Program all transmitters used with this vehicle. Proceed to number 11. 4. Obtain the Vehicle's unique PIN number assigned to it's original SKIM module from either the vehicle's invoice or from Chrysler's Customer Center (1-800-992-1997). 5. With the DRBIII, select THEFT ALARM, SKIM, MISCELLANEOUS and select "Skim Module Replaced" function. Enter the 4 digit PIN number to put SKIM in "Access Mode". 6. The DRBIII will prompt you through the following steps. (1) Program the country code into the SKIM's memory. (2) Program the vehicle's VIN number into the SKIM's memory. (3) Transfer the vehicle's Secret Key data from the PCM. 7. Once secured access mode is active, the SKIM will remain in that mode for 60 seconds. 8. Using the DRBIII, program all customer keys into the SKIM's memory. This requires that the SKIM be in secured access mode, using the 4 digit code. 9. Note: If the PCM is replaced, the unique Secret Key data must be transferred from the SKIM to the PCM. This procedure requires the SKIM to be placed in secured access mode using the 4-digit code. 10. Note: If 3 attempts are made to enter secured access mode using an incorrect PIN, secured access mode will be locked out for 1 hour which causes the DRB III to display "Bus +\ - Signals Open". To exit this mode, turn ignition to the "Run" pos. for 1 hour. 11. Ensure all accessories are turned off and the battery is fully charged. 12. Ensure that the Ignition is on, and with the DRBIII®, erase all Diagnostic Trouble Codes from ALL modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was malfunctioning. 13. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRBIII®, read DTC's from ALL modules. 14. If ANY codes are present, select the appropriate symptom from the Symptom List and continue diagnostics. If NO codes are present and the customers complaint cannot be duplicated, the repair is complete. 	All

POWERTRAIN VERIFICATION TEST VER - 1	APPLICABILITY
<ol style="list-style-type: none"> 1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. Inspect the engine oil for contamination. If it is contaminated, change the oil and filter. 3. Perform the steps 4 through 6 if the PCM has been replaced. Then proceed with the verification. If the PCM has not been replaced skip those steps and continue verification. 4. If PCM has been changed and correct VIN and mileage have not been programmed a DTC will be set in ABS and Air Bag modules. In addition, if vehicle is equipped with a Sentry Key Immobilizer Module (SKIM), Secret Key data must be updated to enable start. 5. For ABS and Air Bag systems: Enter correct VIN and Mileage in PCM. Erase codes in ABS and Air Bag modules. 6. For SKIM theft alarm: Connect DRBIII® to data link conn. Go to Theft Alarm, SKIM, Misc. and place SKIM in secured access mode, by using the appropriate PIN code for this vehicle. Select Update the Secret Key data. Data will be transferred from SKIM to PCM 7. Attempt to start the engine. 8. If the engine is unable to start, look for any Technical Service Bulletins that may relate to this condition. Return to Symptom List if necessary. 9. If the engine starts and stays running, the repair is now complete. 	All

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 2	APPLICABILITY
<ol style="list-style-type: none"> 1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. If this verification procedure is being performed after a NO TROUBLE CODE repair, perform steps 3 and 4. 3. Check to see if the initial symptom still exists. If there are DTCs or the symptom no longer exists, the repair was successful and testing is complete. 4. If the initial or another symptom exists, the repair is not complete. Check all technical service bulletins or flash updates and return to Symptoms if necessary. 5. If this verification procedure is being performed after a DTC repair, perform steps 6 through 11. 6. Connect the DRBIII® to the data link connector. With the DRBIII®, erase DTCs and reset all values. 7. If the PCM has been replaced, perform steps 8 through 10, then proceed with the verification. If the PCM has not been replaced, skip those steps and continue verification. 8. If PCM has been replaced and correct VIN and mileage have not been programmed, a DTC will be set in ABS and Air bag modules. In addition, if vehicle is equipped with a Sentry Key Immobilizer System (SKIS), Secret Key data must be updated to enable start. 9. For ABS and Air Bag systems: Enter correct VIN and Mileage in PCM. Erase codes in ABS and Air Bag modules. 10. For SKIS theft alarm: Connect DRBIII® to data link conn. Go to Theft Alarm, SKIM, and Misc. Place SKIM in secured access mode by using the appropriate PIN code for this vehicle. Select Update the Secret Key data. Data will be transferred from SKIM to PCM 11. Road test the vehicle. If the test is for an A/C DTC, ensure it is operating during the following test. Drive the vehicle for at least 5 minutes. 12. Drive the vehicle at least 64 kmh (40 mph). Ensure the trans shifts through all gears. At some point stop the vehicle, turn off the engine for at least 10 seconds. When finished read DTCs with the DRB. If a DTC has set, return to Symptoms and follow path. 13. If the original DTC did not return and there are no new DTCs, the repair was successful and testing is complete. 	All

SKIS VERIFICATION	APPLICABILITY
<ol style="list-style-type: none"> 1. Reconnect all previously disconnected components and connectors. 2. Obtain the vehicle's unique Personal Identification Number (PIN) assigned to it's original SKIM. This number can be obtained from the vehicle's invoice or Chrysler's Customer Center (1-800-992-1997). 3. NOTE: When entering the PIN, care should be taken because the SKIM will only allow 3 consecutive attempts to enter the correct PIN. If 3 consecutive incorrect PIN's are entered the SKIM will Lock Out the DRB III for 1 hour. 4. To exit Lock Out mode, the ignition key must remain in the Run position continually for 1 hour. Turn off all accessories and connect a battery charger if necessary. 5. With the DRB III, select Theft Alarm, SKIM and Miscellaneous. Then select desired procedure and follow the steps that will be displayed. 6. If the SKIM has been replaced, ensure all of the vehicle ignition keys are programmed to the new SKIM. 7. NOTE: Prior to returning vehicle to the costumer, perform a module scan to be sure that all DTC's are erased. Erase any DTC's that are found. 8. With the DRB III erase all DTC's. Perform 5 ignition key cycles leaving the key on for at least 90 seconds per cycle. 9. With the DRB III, read the SKIM DTC's. Are there any SKIM DTC's? <div style="margin-left: 40px;"> Yes → Repair is not complete, refer to appropriate symptom. No → Repair is complete. </div> 	All

SHORTING CLIPS

AIRBAG CONTROL MODULE CONNECTOR

SHORTING CLIPS

A SHORTING CLIP IS ONE SAFEGUARD BUILT INTO THE AIRBAG SYSTEM TO PREVENT ACCIDENTAL DEPLOYMENT WHEN HANDLING THE AIRBAG ASSEMBLY. STATIC CHARGES OR RADIO FREQUENCY NOISE CAN CAUSE ELECTRICAL POTENTIAL TO DEVELOP IN THE AIRBAG INITIATOR. SHORTING CLIPS PREVENT THIS WHEN THE CONNECTOR IS REMOVED FROM THE CONTROL MODULE.

DO NOT PROBE, BEND OR REMOVE SHORTING CLIPS

1.0 INTRODUCTION

The procedures contained in this manual include all the specifications, instructions, and graphics needed to diagnose Mark 20 Antilock Braking System (ABS) problems. The diagnostics in this manual are based on the failure condition or symptom being present at the time of diagnosis.

When repairs are required, refer to the appropriate service manual for the proper removal and repair procedure.

Follow the recommendations below when choosing your diagnostic path.

1. First make sure the DRBIII® is communicating with the CAB. If the DRBIII® displays a "No Response" condition, you must diagnose that first.
2. Read DTC's (diagnostic trouble codes) with the DRBIII®.
3. If no DTC's are present, identify the customer complaint.
4. Once the DTC or customer complaint is identified, locate the matching test in the Table of Contents and begin to diagnose the symptom.

All component location views are in Section 8.0. All connector pinouts are in Section 9.0. All schematics are in Section 10.0.

An * placed before the symptom description indicated a customer complaint.

Diagnostic procedures change every year. New diagnostic systems may be added; carryover systems may be enhanced. **READ THIS MANUAL BEFORE TRYING TO DIAGNOSE A VEHICLE CODE.** It is recommended that you review the entire manual to become familiar with all new and changed diagnostic procedures.

After using this book, if you have any comments or recommendations, please fill out the form at the back of the book and mail it back to us.

1.1 SYSTEM COVERAGE

This diagnostic manual covers the Teves Mark 20 Antilock Braking System (ABS) found on the 2001 Jeep Cherokee.

1.2 SIX-STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the antilock brake system is done in six basic steps:

- verification of complaint
- verification of any related symptoms
- symptom analysis
- problem isolation

- repair of isolated problem
- verification of proper operation

2.0 IDENTIFICATION OF SYSTEM

Vehicles equipped with the Teves Mark 20 antilock brake system can be identified by the presence of the hydraulic control unit located with the controller antilock brake (CAB) under the hood near the air cleaner housing.

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

3.1 TEVES ABS SYSTEM DESCRIPTION

An electronic control module is used to monitor wheel speeds and to modulate (control) hydraulic pressure in each brake channel to prevent wheel lock-up during braking.

During a non-ABS stop, the system functions as a standard front/rear split configuration. The primary hydraulic system supplies brake fluid pressure to the front brakes, and the secondary hydraulic system supplies the rear brakes. A conventional combination/proportioning valve is used.

During an ABS stop, the system still uses the front/rear hydraulic split; however, the brakes system pressure is further split into three control channels. During ABS operation, the front wheels are controlled independently and are on two separate control channels. The rear wheels are controlled together through one control channel. By using separate control channels for the front wheels, more steering control is maintained during maximum braking.

During an antilock stop, "wheel lock-up" does not necessarily mean that the wheel has locked, it means only that the wheel is turning slower than the vehicle speed. This is called "wheel slip" and is indicated as a percentage. 0% slip means that the wheel is rolling free and 100% slip means that the wheel is locked. The antilock system maintains an average of approximately 20% wheel slip.

It is important to remember that the antilock brake system does not shorten the vehicle stopping distance under all driving conditions, but provides improved control of the vehicle while stopping. Vehicle stopping distance is still dependent on vehicle speed, weight, tires, road surface, and other factors.

3.1.1 PEDAL FEEL/VEHICLE CHARACTERISTICS

There are several pedal feel/vehicle characteristics that are considered normal for antilock braking that may require further explanation.

When stopping conditions activate the antilock brakes, the driver may feel some vibrations/pulsations in the brake pedal and may hear the solenoid valves clicking and the pump motor running. The vibrations/pulsations are caused by the isolating, building and decaying of brake fluid pressure within the brake lines. The ABS prevents complete wheel lock-up, but some wheel slip is required for the best braking performance. This slip may result in some tire chirping, depending on the road surface. This chirping should not be interpreted as total wheel lock-up. Total wheel lock-up leaves black tire marks on dry pavement. Antilock braking may leave some light marks.

At the end of an ABS stop, the ABS system may not function below 5 Km/h (3 mph). There may be a slight brake pedal drop anytime the ABS is deactivated.

In case of braking on a bumpy surface, the ABS module may detect wheel locking tendencies due to wheel hop and cycle ABS. In that event the brake pedal may pulsate with a perceived loss of deceleration. ABS braking may also be activated at times while on dry pavement with sand, gravel, or other loose road debris.

It should be noted that the pulsating pedal feel characteristic will not illuminate the brake warning lamps or set a trouble code that is stored in the Controller Antilock Brake (CAB). When investigating a hard pedal feel, inspect the sensor and tone wheel teeth for chips/broken teeth, damaged sensor pole tips, excessive runout of the tone wheel, or excessive gap.

3.1.2 SYSTEM COMPONENTS

ANTILOCK BRAKE SYSTEM

- controller antilock brake (CAB)
- vacuum booster
- master cylinder (w/center valves)
- hydraulic control unit (HCU)
- valve block assembly: 6 valve solenoids (3 inlet valves, 3 outlet valves), 4 accumulators
- pump/motor assembly:
 - 1 motor
 - 2 pumps
- G (acceleration) switch
- 1 proportioning valve
- 4 wheel speed sensor/tone wheel assemblies
- ABS warning indicator

- fuses and wiring harness
- fluid reservoir (integral part of master cylinder assembly)

3.1.3 ABS AND BRAKE WARNING INDICATOR

The amber ABS warning indicator is located in the instrument cluster. It is used to inform the driver that the antilock function has been turned off due to a system malfunction. On some systems the warning indicator is controlled directly by the CAB. On an XJ, the CAB controls the indicator indirectly. The ABS light relay provides a ground path for the ABS warning indicator driver. The CAB grounds the ABS light relay control circuit to turn off the indicator.

The red brake warning indicator is located in the instrument cluster. It can be activated by application of the parking brake, a leak in the front or rear wheel brake hydraulic circuit, or by turning the ignition switch to the start position.

3.1.4 CONTROLLER ANTILOCK BRAKE (CAB)

The controller antilock brake (CAB) is a microprocessor-based device that monitors wheel speeds and controls the antilock functions.

The primary functions of the CAB are:

- monitor wheel speeds
- detect wheel locking tendencies
- control fluid pressure modulation to the brakes during antilock stop operation
- monitor the system for proper operation
- provide communication to the DRBIII® while in diagnostic mode
- control the ABS light relay
- store diagnostic information in non-volatile memory

The CAB continuously monitors the speed of each wheel. When a wheel locking tendency is detected, the CAB will command the appropriate valve in the HCU to modulate brake fluid pressure to that wheel. Brake pedal position is maintained during an antilock stop by being a closed system with the use of 3 accumulators. The CAB continues to control pressure in individual hydraulic circuits until a wheel locking tendency is no longer present. The CAB turns on the pump/motor during an antilock stop.

The antilock brake system is constantly monitored by the CAB for proper operation. If the CAB detects a system malfunction, it can disable the antilock system and turn on the ABS warning indicator. If the antilock function is disabled, the system will revert to standard base brake system operation.

The CAB inputs include the following:

- four wheel speed sensors
- brake switch
- ignition switch
- battery voltage
- diagnostic communication ISO/K
- G switch (acceleration switch)

The CAB outputs include the following:

- six valve/solenoid drivers
- pump/motor actuation
- ABS light relay control
- diagnostic communication

3.1.5 HYDRAULIC CONTROL UNIT

The hydraulic control unit (HCU) contains the valve block assembly, four accumulators, and the pump/motor assembly.

Valve Block Assembly: The valve block assembly contains 6 valves with three inlet valves and three outlet valves. The inlet valves are spring-loaded in the open position and the outlet valves are spring loaded in the closed position. During an antilock stop, these valves are cycled to maintain the proper slip ratio for each channel. If a wheel locks, the inlet valve is closed to prevent any further pressure increase. Then the outlet valve is opened to release the pressure to the accumulators until the wheel is no longer slipping. Once the wheel is no longer slipping, the outlet valve is closed and the inlet valve is opened to reapply pressure. If the wheel is decelerating within its predetermined limits (proper slip ratio), both valves will close to hold the pressure constant.

Pump/Motor Assembly: The pump/motor assembly provides the extra amount of fluid needed during antilock braking. The pump is supplied fluid that is released to the accumulators when the outlet valve is opened during an antilock stop. The pump is also used to drain the accumulator circuits after the antilock stop is complete. The pump is operated by an integral electric motor. This motor is controlled by the CAB. The CAB turns on the motor when an antilock stop is detected. The pump continues to run during the antilock stop and is turned off approximately 3-5 seconds after the stop is complete. The pump mechanism consists of two opposing pistons operated by an eccentric cam. One piston supplies the primary hydraulic circuit. The opposing piston supplies the secondary hydraulic circuit. In operation, one piston draws fluid from the accumulators. The opposing piston pumps fluid to the valve body solenoids. The CAB monitors the pump/motor operation.

Accumulators: The accumulators provide temporary fluid storage during an antilock stop and are drained by the pump/motor.

3.1.6 SENSORS

Wheel Speed Sensors and Tone Wheels: One wheel speed sensor (WSS) is located at each wheel and sends a low voltage AC signal to the controller antilock brake (CAB). This voltage is generated by magnetic induction when a toothed sensor ring (tone wheel) passes by a stationary magnetic sensor (wheel speed sensor). The CAB converts the AC signals into digital signals for each wheel.

The front wheel sensor is attached to a boss in the steering knuckle. The tone wheel is an integral part of the front axle shaft. The rear speed sensor is mounted in the caliper adapter plate (rear disc only) and the rear tone wheel is an integral part of the rear rotor hub. The front wheel speed sensor air gap is NOT adjustable. The correct front wheel speed sensor air gap is from 0.40mm to 1.3mm (0.016" to 0.051"). Preferred rear sensor air gap for drum brake systems is 1.1mm (0.043"). Acceptable air gap range is 0.92mm to 1.275mm (0.036" to 0.050"). For rear disc brake systems, the preferred rear sensor air gap is 1.2mm (0.047"). Acceptable air gap range is 0.95mm to 1.45mm (0.037" to 0.057"). All wheel speed sensors have a resistance between 900 and 1300 ohms.

Correct antilock system operation is dependent on correct wheel speed signals generated by the interaction of the tone wheels with the wheel speed sensors. The vehicle's wheels and tires should all be the same size and type to generate accurate signals. In addition, the tires should be inflated to the recommended pressures for optimum system operation. Variations in wheel and tire size or significant variations in inflation pressure can produce inaccurate wheel speed signals; however, the system will continue to function when using the mini-spare. When driven over rough road surfaces, the rear wheel speed sensor signals may be erratic and cause a false trouble code (drum brakes only).

G (Acceleration) Switch: The CAB monitors the acceleration switch at all times. The switch assembly contains three mercury switches that monitor vehicle deceleration rates (G-force). Sudden, rapid changes in vehicle and wheel deceleration rate trigger the switch, sending a signal to the CAB. The switch assembly responds to three deceleration rates; two for forward braking and one for rearward braking.

GENERAL INFORMATION

3.2 DIAGNOSTIC TROUBLE CODES

The Teves Mark 20 Antilock Brake System (ABS) module may report any of the following diagnostic trouble codes:

- CAB Power Feed Circuit
- Controller Failure
- G Switch Not Processable
- Left Front Sensor Circuit Failure
- Left Front Sensor Signal Failure
- Left Rear Sensor Circuit Failure
- Left Rear Sensor Signal Failure
- Pump Motor Circuit Not Working Properly
- Right Front Sensor Circuit Failure
- Right Front Sensor Signal Failure
- Right Rear Sensor Circuit Failure
- Right Rear Sensor Signal Failure
- System Overvoltage
- System Undervoltage

Diagnostic trouble codes are retained in memory until erased using the DRBIII®, or automatically erased after 255 key cycles.

3.2.1 SYSTEM INITIALIZATION

System initialization starts when the key is turned to “run”. At this point, the CAB performs a complete self-check of all electrical components in the antilock brake systems.

At around 12 miles per hour, the pump motor is briefly activated to test operation, and wheel speed sensor circuitry is checked. If for any reason the brake switch is activated when the vehicle reaches 12 mph, this check will be delayed until 25 mph. The driver may feel the test through brake pedal pulsations. This is a normal condition. Throughout the remainder of the drive cycle, ongoing tests are performed, and the CAB monitors ABS circuits for continuity.

If, during initialization or dynamic checks, the CAB detects a condition causing it to set a diagnostic code, it will remove the ground from the ABS light relay control circuit. The relay will deactivate and allow the ABS warning indicator driver to be grounded, which will illuminate the ABS warning indicator.

3.2.2 DIAGNOSTIC MODE

On a Mark 20 system to enter diagnostic mode, vehicle speed must be below 10 km/h (6 mph) and no ABS condition present. If vehicle speed is not below 10 km/h (6 mph), a “no response” message will be displayed by the DRBIII®. The following are characteristics of diagnostic mode:

- The amber ABS warning indicator will blink rapidly (about 1/2 second on and 1/2 second off). If

a hard trouble code is present, such as a CAB Power Feed Circuit trouble code, the indicator will be illuminated without blinking until the diagnostic trouble code condition is corrected.

- Antilock operation is disabled.

3.2.3 INTERMITTENT DIAGNOSTIC TROUBLE CODES

If the malfunction is not present while performing a test procedure, the diagnostic procedures will not locate the problem. In this case, the code can only suggest an area to inspect. Check for the following:

- loose or corroded connections
- damaged components (sensors, tone wheels especially)
- damaged wiring
- excessive axle shaft runout
- brake system hydraulic leaks
- brake system problems, non-ABS related.

If no obvious problems are found, erase diagnostic trouble codes and, with the key on, wiggle the wire harness and connectors. Recheck for codes periodically as you work through the system. This procedure may uncover an intermittent or difficult to locate malfunction.

3.3 USING THE DRBIII®

Refer to the DRBIII® user's guide for instructions and assistance with reading trouble codes, erasing trouble codes and other DRBIII® functions.

3.4 DRBIII® ERROR MESSAGES

Under normal operation, the DRBIII® will display one of only two error messages:

- User-Requested WARM Boot or User-Requested COLD Boot

If the DRBIII® should display any other error message, record the entire display and call the MDS Hotline for information and assistance (1-800-825-8737). This is a sample of such an error message display:

```
over: 2.14
date: 26 Jul 93
file: key_itf.cc
date: Jul 26 1993
line: 548
err: 0x1
User-Requested COLD Boot
```

Press MORE to switch between this display and the application screen.
Press F4 when done noting information.

3.4.1 DRBIII® DOES NOT POWER UP (BLANK SCREEN)

If the LED's do not light or no sound is emitted at start up, check for loose cable connections or a bad cable. Check the vehicle battery voltage (data link 16-way connector cavity 16). A minimum of 11 volts is required to adequately power the DRBIII®. Also, check for a good ground at the DLC.

If all connections are proper between the DRBIII® and the vehicle or other devices, and the vehicle battery is fully charged, and inoperative DRBIII® may be the result of faulty cable or vehicle wiring.

3.4.2 DISPLAY IS NOT VISIBLE

Low temperatures will affect the visibility of the display. Adjust the contrast to compensate for this condition.

4.0 DISCLAIMERS, SAFETY WARNINGS

4.1 DISCLAIMERS

All information, illustrations, and specifications contained in this manual are based on the latest information available at the time of publication. The right is reserved to make changes at any time without notice.

4.2 SAFETY

4.2.1 TECHNICAN SAFETY INFORMATION

WARNING: ENGINES PRODUCE CARBON MONOXIDE THAT IS ODORLESS, CAUSES SLOWER REACTION TIME, AND CAN LEAD TO SERIOUS INJURY. WHEN THE ENGINE IS OPERATING, KEEP SERVICE AREAS WELL VENTILATED OR ATTACH THE VEHICLE EXHAUST SYSTEM TO THE SHOP EXHAUST REMOVAL SYSTEM.

Set the parking brake and block the wheels before testing or repairing the vehicle. It is especially important to block the wheels on four-wheel drive vehicles; the parking brake does not hold the front drive wheels.

When servicing a vehicle, always wear eye protection, and remove any metal jewelry such as watchbands or bracelets that might make an inadvertent electrical contact.

When diagnosing an antilock brake or speed proportional steering system problem, it is important to follow approved procedures where applicable. These procedures can be found in the service manual. Following these procedures is very important to the safety of individuals diagnostic tests.

4.2.2 VEHICLE PREPARATION FOR TESTING

Make sure the vehicle being tested has a fully charged battery. If it does not, false diagnostic codes or error messages may occur.

4.2.3 SERVICING SUB-ASSEMBLIES

Some components of the antilock brake or speed proportional steering system are intended to be serviced in assembly only. Attempting to remove or repair certain system sub-components may result in personal injury and/or improper system operation. Only those components with approved repair and installation procedures in the service manual should be serviced.

GENERAL INFORMATION

4.2.4 DRBIII® SAFETY INFORMATION

WARNING: EXCEEDING THE LIMITS OF THE DRBIII® MULTIMETER IS DANGEROUS. IT CAN EXPOSE YOU TO SERIOUS OR POSSIBLE FATAL INJURY. CAREFULLY READ AND UNDERSTAND THE CAUTIONS AND THE SPECIFICATION LIMITS.

- Follow the vehicle manufacturer's service specifications at all times.
- Do not use the DRBIII® if it has been damaged.
- Do not use the test leads if the insulation is damaged or if metal is exposed.
- To avoid electrical shock, do not touch the test leads, tips, or the circuit being tested.
- Choose the proper range and function for the measurement. Do not try voltage or current measurements that may exceed the rated capacity.
- Do not exceed the limits shown in the table below:

FUNCTION	INPUT LIMIT
Volts	0 - 500 peak volts AC 0 - 500 volts DC
Ohms (resistance)*	0 - 1.12 megohms
Frequency Measured Frequency Generated	0 - 10 kHz
Temperature	-58 - 1100°F -50 - 600°C

* Ohms cannot be measured if voltage is present. Ohms can be measured only in a non-powered circuit.

- Voltage between any terminal and ground must not exceed 500v DC or 500v peak AC.
- Use caution when measuring voltage above 25v DC or 25v AC.
- Use the low current shunt to measure circuits up to 10A. Use the high current clamp to measure circuits exceeding 10A.
- When testing for the presence of voltage or current, make sure the meter is functioning correctly. Take a reading of a known voltage or current before accepting a zero reading.
- When measuring current, connect the meter in series with the load.
- Disconnect the live test lead before disconnecting the common test lead.
- When using the meter function, keep the DRBIII® away from spark plug or coil wires to avoid measuring error from outside interference.

4.3 WARNING

4.3.1 VEHICLE DAMAGE WARNINGS

Before disconnecting any control module, make sure the ignition is "off". Failure to do so could damage the module.

When testing voltage or continuity at any control module, use the terminal side (not the wire end) of the connector. Do not probe a wire through the insulation; this will damage it and eventually cause it to fail because of corrosion.

Be careful when performing electrical tests so as to prevent accidental shorting of terminals. Such mistakes can damage fuses or components. Also, a second code could be set, making diagnosis of the original problem more difficult.

4.3.2 ROAD TESTING A COMPLAINT VEHICLE

Some complaints will require a test drive as part of the repair verification procedure. The purpose of the test drive is to try to duplicate the diagnostic code or symptom condition.

WARNING: BEFORE ROAD TESTING A VEHICLE, BE SURE THAT ALL COMPONENTS ARE REASSEMBLED. DURING THE TEST DRIVE, DO NOT TRY TO READ THE DRBIII® SCREEN WHILE IN MOTION. DO NOT HANG THE DRBIII® FROM THE REAR VIEW MIRROR OR OPERATE IT YOURSELF. HAVE AN ASSISTANT AVAILABLE TO OPERATE THE DRBIII®.

4.4 DIAGNOSIS

1. Your diagnostic test procedure must begin with a thorough visual inspection of the ABS system for damaged components or disconnected connectors. The brake lamps must be operational, and if they are not, repair them prior to continuing.
2. Connect the DRBIII® to the data link connector located under the dash to the left of the steering column. If the DRBIII® does not power up, check the power and ground supplies to the connector.
3. Select "Antilock Brakes". Turn the ignition on. If the DRBIII® displays "No Response", perform the proper test.
4. Read and record all ABS diagnostic trouble codes. If the "CAB Power Feed Circuit" trouble code is present, it must be repaired prior the addressing and other DTC's. If any additional codes are present, proceed to the appropriate test.

5. If there are no diagnostic trouble codes present, select "Inputs/Outputs" and read the brake switch input as you press and release the brake pedal. If the display does not match the state of the pedal, perform appropriate test. Read the "G-Switch" status, with the vehicle on a level surface, both switches should read "CLOSED". If the status is not correct, perform appropriate test. If a problem with the amber ABS warning indicator exists, refer to the system tests.
6. If no other problem are found, it will be necessary to road test the vehicle. **THE DRB MUST NOT BE CONNECTED TO THE DATA LINK CONNECTOR WHEN ROAD TESTING FOR PROPER ANTILOCK OPERATION. THE SYSTEM IS DISABLED WHILE IN DIAGNOSTIC MODE.** Perform several antilock stops from above 50 Km/h (30 mph) and then repeat steps 2, 3, and 4. If any diagnostic trouble codes are present, proceed to the appropriate test.
7. The following conditions should be considered NORMAL operation, and no repairs should be attempted to correct them.
 - Brake pedal feedback during an ABS stop (clicking, vibrating)
 - Clicking, groaning or buzzing at 10 Km/h (6 mph) (drive off self test)
 - Groaning noise during an ABS stop
 - Slight brake pedal drop and pop noise when ignition is initially turned on
 - Brake pedal ratcheting down at the end of an ABS stop
8. If the complaint is ABS "cycling" at the end of a stop at low speeds, it may be caused by a marginal wheel speed sensor signal. The sensor air gap, tone wheel condition, and/or brakes hanging up are possible causes of this condition.
9. After a road test in which problems were found, refer to any Technical Service Bulletins that may apply.

5.0 REQUIRED TOOLS AND EQUIPMENT

DRBIII® (diagnostic read-out box)
 jumper wires
 ohmmeter
 voltmeter
 test lamp

6.0 GLOSSARY OF TERMS

ABS	antilock brake system

NOTES

7.0

DIAGNOSTIC INFORMATION AND PROCEDURES

BRAKES (CAB)

Symptom: CAB POWER FEED CIRCUIT

When Monitored and Set Condition:

CAB POWER FEED CIRCUIT

When Monitored: Ignition on. The CAB monitors the Fused B(+) circuit at all times for proper system voltage.

Set Condition: If the Fused B(+) voltage is missing when the CAB detects that an internal main driver is not "on", the Diagnostic Trouble Code (DTC) is set.

POSSIBLE CAUSES

INTERMITTENT DTC
BLOWN FUSE - FUSED B(+) CIRCUIT
FUSED B(+) CIRCUIT OPEN
FUSED B(+) CIRCUIT INTERMITTENTLY SHORTED TO GROUND
FUSED B(+) CIRCUIT SHORTED TO GROUND
NO B+ SUPPLY TO FUSE
CAB - FUSED B(+) CIRCUIT OPEN
CAB - FUSED B(+) CIRCUIT SHORTED TO GROUND

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase DTC's. Turn the ignition off. Turn the ignition on. Drive the vehicle above 25 km/h (15 mph) for at least 10 seconds. Stop the vehicle. With the DRBIII®, read DTC's. Does the DRBIII® display CAB Power Feed Circuit DTC present right now? Yes → Go To 2 No → Test Complete.	All
2	Turn the ignition off. Remove and Inspect the ABS Solenoid Fuse #13 in the Power Distribution Center (PDC). Is the Fuse blown? Yes → Go To 3 No → Go To 7	All

CAB POWER FEED CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Visually inspect the Fused B(+) Circuit in the wiring harness from the Junction Block to the CAB. Look for any sign of an intermittent short to ground. Is the wiring harness OK?</p> <p>Yes → Go To 4</p> <p>No → Repair the Fused B(+) Circuit Shorted to Ground. Perform ABS VERIFICATION TEST - VER 1.</p>	All
4	<p>Turn the ignition off. Remove the ABS Fuse 25 from the Junction Block. Disconnect the CAB harness connector. Note: Check connector - Clean/repair as necessary. Using a test light connected to 12 volts, probe the Fused B(+) Circuit. Is the test light on?</p> <p>Yes → Repair the Fused B(+) Circuit Shorted to Ground. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Remove the ABS Solenoid Fuse from the PDC. The CAB must be connected for the results of this test to be valid. Using a test light connected to 12 volts, probe the Fused B(+) Circuit at the Junction Block fuse terminal. Is the test light on?</p> <p>Yes → Replace the CAB. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off. If there are no potential causes remaining, view repair. If there are no potential causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Fuse. Perform ABS VERIFICATION TEST - VER 1.</p>	All
7	<p>Turn the ignition off. Remove the ABS Solenoid Fuse from the Power Distribution Center (PDC). Disconnect the CAB harness connector. Note: Check connector - Clean/repair as necessary. Measure the resistance of the Fused B(+) circuit between the PDC Fuse terminal and the CAB connector. Is the resistance below 5 ohms?</p> <p>Yes → Go To 8</p> <p>No → Repair Fused B(+) Circuit Open. Perform ABS VERIFICATION TEST - VER 1.</p>	All

CAB POWER FEED CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
8	<p>Remove the ABS Fuse 25 from the Junction Block. Turn the ignition on. Measure the voltage of the Fused B+ supply to Fuse 25 in the Junction Block. Is the voltage above 10 volts?</p> <p>Yes → Go To 9</p> <p>No → Repair the B+ Supply circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All
9	<p>If there are no potential causes remaining, view repair.</p> <p>Repair</p> <p>Replace the CAB. Perform ABS VERIFICATION TEST - VER 1.</p>	All

Symptom:

CONTROLLER FAILURE

When Monitored and Set Condition:

CONTROLLER FAILURE

When Monitored: Ignition on. The CAB monitors its internal microprocessors for correct operation.

Set Condition: If the CAB detects an internal fault, the DTC is set.

POSSIBLE CAUSES

GROUND AND POWER CONNECTIONS

GROUND CIRCUIT HIGH RESISTANCE

GROUND CIRCUIT INTERFERENCE

CAB - INTERNAL FAILURE

TEST	ACTION	APPLICABILITY
1	Inspect for non-factory wiring that may interfere with CAB power or ground circuits. Disconnect the CAB harness connector. Inspect the CAB wiring harness for incorrect routing and damage. Inspect the CAB harness and component connectors for corrosion and damage. Were any concerns found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Go To 2	All
2	Turn the ignition off. Disconnect the CAB harness connector. Note: Check connector - Clean/repair as necessary. Measure the resistance of the CAB ground circuits to body ground. Is the resistance below 1.0 ohm? Yes → Go To 3 No → Repair the Ground circuit high resistance. Perform ABS VERIFICATION TEST - VER 1.	All
3	Turn the ignition off. Disconnect the CAB harness connector. Note: Check connector - Clean/repair as necessary. Turn the ignition on. Turn on all accessories. Measure the voltage of the Ground circuit. Is the voltage below 1.0 volts? Yes → Go To 4 No → Repair as necessary. Unsplice any accessories connected to the CAB ground circuit. Reroute and shield any high voltage cables away from the CAB ground circuit. Perform ABS VERIFICATION TEST - VER 1.	All

BRAKES (CAB)

CONTROLLER FAILURE — Continued

TEST	ACTION	APPLICABILITY
4	If there are no potential causes remaining, view repair. Repair Replace the CAB. Perform ABS VERIFICATION TEST - VER 1.	All

Symptom:
G-SWITCH NOT PROCESSABLE

When Monitored and Set Condition:

G-SWITCH NOT PROCESSABLE

When Monitored: Ignition on. The CAB sends a test signal out to the G-switch and monitors the sense circuits #1 and #2.

Set Condition: If the sense circuits are open for 2 minutes while driving or an otherwise improper signal is detected at any time, the Diagnostic Trouble Code (DTC) is set.

POSSIBLE CAUSES

G-SWITCH TEST SIGNAL CIRCUIT OPEN
 INTERMITTENT DTC
 G-SWITCH TEST SIGNAL OR SENSE CIRCUIT SHORT TO VOLTAGE OR GROUND
 G-SWITCH SIGNAL CIRCUIT INTERNAL OPEN
 CAB - TEST SIGNAL CIRCUIT OPEN
 G-SWITCH #1 SENSE CIRCUIT OPEN
 G-SWITCH #1 SENSE SWITCH OPEN
 CAB - #1 SENSE CIRCUIT OPEN
 G-SWITCH #2 SENSE CIRCUIT OPEN
 G-SWITCH #2 SENSE SWITCH OPEN
 CAB - #2 SENSE CIRCUIT OPEN

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read the status of the G-Switch internal switches. What is the status of both of the G-Switches? Both G-Switches are closed. Go To 2 Both G-Switches are open. Go To 3 Only the #1 G-Switch is open. Go To 7 Only the #2 G-Switch is open. Go To 10	All

G-SWITCH NOT PROCESSABLE — Continued

TEST	ACTION	APPLICABILITY
2	<p>Turn the ignition off.</p> <p>Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Refer to any Hotline letters or Technical Service Bulletins that may apply.</p> <p>Were any problems found?</p> <p>Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Test Complete.</p>	All
3	<p>Turn the ignition off.</p> <p>Disconnect the CAB connector.</p> <p>Check connector - Clean/repair as necessary.</p> <p>Disconnect the G-Switch Sensor Connector.</p> <p>NOTE: Check connector - Clean/repair as necessary.</p> <p>Measure the resistance of the G-Switch Test Signal circuit.</p> <p>Is the resistance below 5 ohms?</p> <p>Yes → Go To 4</p> <p>No → Repair the G-Switch Test Signal Circuit Open. Perform ABS VERIFICATION TEST - VER 1.</p>	All
4	<p>Turn the ignition off.</p> <p>Disconnect the CAB Connector.</p> <p>Check connector - Clean/repair as necessary.</p> <p>Disconnect the G-Switch Sensor Connector.</p> <p>Check connector - Clean/repair as necessary.</p> <p>Turn the ignition on.</p> <p>Using a 12-volt test light connected to ground, check the Test Signal and both Sense circuits.</p> <p>Using a 12-volt test light connected to 12-volts, check the Test Signal and both Sense circuits.</p> <p>CAUTION: The test light should not light at any test point.</p> <p>Does the test light illuminate at any test point?</p> <p>Yes → Repair the G-Switch Test Signal or Sense circuit for a short to voltage or ground. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off.</p> <p>Disconnect the G-Switch Connector.</p> <p>Check connector - Clean/repair as necessary.</p> <p>Remove G-Switch from vehicle.</p> <p>While holding the G-Switch level, measure the resistance of the G-Switch Test Signal circuit and the G-Switch #1 Sense circuit in the G-Switch connector.</p> <p>Is the resistance below 5 ohms?</p> <p>Yes → Go To 6</p> <p>No → Replace G-Switch. Perform ABS VERIFICATION TEST - VER 1.</p>	All

7	Turn the ignition off. Visually inspect wheel speed sensor. Visually inspect tone wheel. Visually inspect wiring harness. Visually inspect brakes for locking up due to lining contamination or overheating. Inspect all Components for defects which may cause a Signal DTC to set. Is any Component Damaged? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Go To 8	All

LEFT REAR SENSOR SIGNAL FAILURE — Continued

TEST	ACTION	APPLICABILITY
8	<p>Turn the ignition off. Disconnect the CAB connector. Set up a voltmeter to measure AC voltage on the Left Rear Wheel Speed Sensor Signal Circuits at the CAB connector. Raise the left rear wheel off the ground. Quickly rotate the wheel by spinning the tire by hand. Measure the AC voltage on the Left Rear Wheel Speed Sensor (+) and (-) Signal Circuits. Does the voltage go above 650 millivolts as the wheel is rotated?</p> <p>Yes → Replace the CAB. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Replace the Left Rear Wheel Speed Sensor. Perform ABS VERIFICATION TEST - VER 1.</p>	All

Symptom:**PUMP MOTOR NOT WORKING PROPERLY****When Monitored and Set Condition:****PUMP MOTOR NOT WORKING PROPERLY**

When Monitored: Ignition on. The CAB commands the pump on at 20 km/h (12 mph) to check its operation, if the brake switch is not applied. If the driver has their foot on the brake, the test will run at 40 km/h (25 mph). The CAB monitors pump voltage every 7 milliseconds.

Set Condition: The DTC is stored when the CAB detects: 1) Improper voltage decay after the pump was turned off. 2) Pump not energized by the CAB, but voltage is present for 3.5 seconds. 3) Pump is turned on by the CAB, but there is insufficient voltage to operate it.

POSSIBLE CAUSES

ABS PUMP MOTOR INTERMITTENT DTC
 FUSED B(+) CIRCUIT INTERMITTENTLY SHORTED TO GROUND
 FUSED B(+) CIRCUIT SHORTED TO GROUND
 CAB - FUSED B(+) CIRCUIT SHORTED TO GROUND
 FUSE BLOWN - PUMP MOTOR CIRCUIT
 NO B+ SUPPLY TO FUSE
 ABS PUMP MOTOR INOPERATIVE
 FUSED B(+) CIRCUIT OPEN
 GROUND CIRCUIT OPEN
 GROUND CIRCUIT HIGH RESISTANCE
 CAB - INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. With the DRBIII®, erase DTC's. Turn the ignition off. Turn the ignition on. With the DRBIII®, actuate the ABS pump motor. Did the Pump Motor operate when actuated? No → Go To 2 Yes → Go To 13	All
2	Turn the ignition off. Remove and inspect the ABS Pump fuse in the PDC. Is the Fuse blown? Yes → Go To 3 No → Go To 7	All

PUMP MOTOR NOT WORKING PROPERLY — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off.</p> <p>Visually inspect the Fused B(+) Circuit in the wiring harness from the PDC to the CAB. Look for any sign of an Intermittent Short to Ground.</p> <p>Is the wiring harness OK?</p> <p>Yes → Go To 4</p> <p>No → Repair the Fused B(+) Circuit shorted to ground. Perform ABS VERIFICATION TEST - VER 1.</p>	All
4	<p>Turn the ignition off.</p> <p>Disconnect the ABS PUMP Fuse # 12 from the Power Distribution Center (PDC). Disconnect the CAB connector.</p> <p>Note: Check connector - Clean/repair as necessary.</p> <p>Using a test light connected to 12 volts, probe the Fused B (+) Circuit.</p> <p>Is the test light on?</p> <p>Yes → Repair the Fused B(+) circuit short to ground. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off.</p> <p>Disconnect the ABS PUMP Fuse 12 from the PDC.</p> <p>The CAB must be connected for the results of this test to be valid.</p> <p>Using a test light connected to 12 volts, probe the Fused B (+) circuit in the PDC.</p> <p>Is the test light on?</p> <p>Yes → Replace the CAB. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off.</p> <p>If there are no potential causes remaining, replace the Fuse.</p> <p>View repair options</p> <p>Repair</p> <p>Replace the ABS Pump Motor Fuse. Perform ABS VERIFICATION TEST - VER 1.</p>	All
7	<p>Turn the ignition on.</p> <p>Using a 12-volt test light connected to ground, check the B+ supply to Fuse 12 in the PDC.</p> <p>Is the B+ supply OK?</p> <p>Yes → Go To 8</p> <p>No → Repair the B+ supply for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All

PUMP MOTOR NOT WORKING PROPERLY — Continued

TEST	ACTION	APPLICABILITY
8	<p>Turn the ignition off. Disconnect Pump Motor Connector. Connect a 10 gauge jumper wire between pump motor Fused B (+) circuit and a 40 Amp Fused B (+) circuit. Connect a 10 gauge jumper wire between pump motor ground circuit and a known good body ground. Monitor Pump Motor operation. Is the pump motor running?</p> <p>Yes → Go To 9</p> <p>No → Replace the ABS Pump Motor/Hydraulic Control Unit assembly. Perform ABS VERIFICATION TEST - VER 1.</p>	All
9	<p>Turn the ignition off. Remove the ABS PUMP Fuse #12 from the Power Distribution Center (PDC). Disconnect the CAB connector. Note: Check connector - Clean/repair as necessary. Measure the resistance of the Fused B (+) circuit between the PDC Fuse Terminal and the CAB connector. Is the resistance below 10 ohms?</p> <p>Yes → Go To 10</p> <p>No → Repair the Fused B(+) circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All
10	<p>Turn the ignition off. Disconnect CAB Connector. Note: Check connector - Clean/repair as necessary. Measure the resistance of the CAB ground circuits. Is the resistance below 1.0 ohms?</p> <p>Yes → Go To 11</p> <p>No → Repair the ground circuit circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All
11	<p>Turn the ignition on. With the DRBIII®, enable pump motor actuation. NOTE: Pump motor will not operate, but voltage will be applied. Measure the voltage drop across the ABS ground circuit connection, with pump motor actuation enabled. Is the voltage below 0.1 volt?</p> <p>Yes → Go To 12</p> <p>No → Repair the Ground circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All
12	<p>If there are no potential causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Controller Anti-Lock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p>	All

PUMP MOTOR NOT WORKING PROPERLY — Continued

TEST	ACTION	APPLICABILITY
13	<p>Turn the ignition off.</p> <p>Visually inspect the related wiring harness. Symptom:

RIGHT FRONT SENSOR SIGNAL FAILURE

When Monitored and Set Condition:

RIGHT FRONT SENSOR SIGNAL FAILURE

When Monitored: Wheel speed comparison is checked at drive off or every 7 milliseconds (ms). Wheel speed continuity is checked every 7 milliseconds. Wheel speed phase length supervision is checked every 7 milliseconds.

Set Condition: If, during an ABS stop, the CAB commands any valve solenoid on for an extended length of time, and does not see a corresponding wheel speed change, the Diagnostic Trouble Code (DTC) is set. The DTC can also set if the signal is missing or erratic.

POSSIBLE CAUSES

BOTH RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT AND SIGNAL DTC CONDITIONS PRESENT

RIGHT FRONT WHEEL SPEED SENSOR OR CONNECTOR DAMAGED

TONE WHEEL DAMAGED

RIGHT FRONT WHEEL SPEED SENSOR AIR GAP OUT OF SPECIFICATION

RIGHT FRONT WHEEL BEARING OUT OF SPECIFICATION

RIGHT FRONT WHEEL SPEED SENSOR INOPERATIVE

CAB - WON'T RESPOND TO RIGHT FRONT WHEEL SPEED SENSOR SIGNAL

INTERMITTENT SIGNAL DTC

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Are both Right Front Sensor Signal Failure and Right Front Sensor Circuit Failure displayed? Yes → Refer to symptom Right Front Sensor Circuit Failure in the BRAKES Category. Perform ABS VERIFICATION TEST - VER 1. No → Go To 2	All
2	While an assistant drives the vehicle, monitor the Wheel Speed Sensors using the DRBIII®. Slowly accelerate as straight as possible from a stop to 24 Km/h (15 Mph). Is the Right Front WSS Signal 0 Km/h (0 Mph) or differing from others by more than 5kmh (3mph)? Yes → Go To 3 No → Go To 7	All

RIGHT FRONT SENSOR SIGNAL FAILURE — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Inspect the Right Front Wheel Speed Sensor and Connector. Is the Sensor or Connector Damaged?</p> <p>Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All
4	<p>Turn the ignition off. Inspect the Tone Wheel for damaged or missing teeth, cracks, or looseness. Note: The Tone Wheel Teeth should be perfectly square, not bent or nicked. Is the Tone Wheel OK?</p> <p>Yes → Go To 5</p> <p>No → Replace the Tone Wheel. Perform ABS VERIFICATION TEST - VER 1.</p>	All
5	<p>Turn the ignition off. Using a Feeler Gauge, measure the Wheel Speed Sensor Air Gap. NOTE: The Air Gap should be checked in at least four places on the Tone Wheel. Is the Air Gap between 0.42 mm - 1.71 mm (0.017" - 0.068") ?</p> <p>Yes → Go To 6</p> <p>No → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1.</p>	All
6	<p>Turn the ignition off. Inspect the wheel bearings for excessive runout or clearance. Note: Refer to the appropriate service information, if necessary, for procedures or specifications. Is the bearing clearance OK ?</p> <p>Yes → Go To 8</p> <p>No → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1.</p>	All
7	<p>Turn the ignition off. Visually inspect wheel speed sensor. Visually inspect tone wheel. Visually inspect wiring harness. Symptom:

SYSTEM UNDERVOLTAGE

When Monitored and Set Condition:

SYSTEM UNDERVOLTAGE

When Monitored: Ignition on. The CAB monitors the Fused Ignition Switch Output circuit voltage above 10 km/h (6 mph) every 7 milliseconds for proper system voltage.

Set Condition: If the voltage is below 9.5 volts, the Diagnostic Trouble Code (DTC) is set.

POSSIBLE CAUSES

BATTERY VOLTAGE LOW

INTERMITTENT DTC

FUSED IGNITION SWITCH OUTPUT CIRCUIT HIGH RESISTANCE

GROUND CIRCUIT OPEN

CAB - INTERNAL FAULT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase DTC's. Turn the ignition off. Turn the ignition on. Start the engine. Drive the vehicle above 16 Km/h (10 mph) for at least 20 seconds. Stop the vehicle With the DRBIII®, read DTC's. Does the DRBIII® display System Undervoltage DTC present right now? Yes → Go To 2 No → Go To 6	All
2	Engine Running. Measure the battery voltage. Is the battery voltage below 10 volts? Yes → Refer to appropriate service information for charging system testing and repair. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the CAB connector. Note: Check connector - Clean/repair as necessary. Measure the resistance of the ground circuits. Is the resistance below 1.0 ohm? Yes → Go To 4 No → Repair the Ground circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All

SYSTEM UNDERVOLTAGE — Continued

TEST	ACTION	APPLICABILITY
4	Disconnect the CAB harness connector. Turn the ignition on. Measure the voltage of the Fused Ignition Switch circuit. Is the voltage above 10 volts? Yes → Go To 5 No → Repair the Fused Ignition Switch Output Circuit for high resistance Perform ABS VERIFICATION TEST - VER 1.	All
5	If there are no potential causes remaining, view repair. Repair Replace the Controller Antilock Brake. Perform ABS VERIFICATION TEST - VER 1.	All
6	Turn the ignition off. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Refer to any Hotline letters or Technical Service Bulletins that may apply. Were any problems found? Yes → Repair as necessary. Perform ABS VERIFICATION TEST - VER 1. No → Test Complete.	All

Symptom:***ABS WARNING INDICATOR ALWAYS ON****POSSIBLE CAUSES**

ABS RELAY STUCK
 ABS RELAY FUSED B+ CIRCUIT OPEN
 ABS RELAY CONTROL CIRCUIT OPEN
 CAB INTERNAL OPEN
 ABS INDICATOR DRIVER SHORT TO GROUND
 INSTRUMENT CLUSTER CONCERN

TEST	ACTION	APPLICABILITY
1	Remove the ABS relay from PDC. Perform the key-on bulb test. Does the ABS Indicator light and remain lit? Yes → Go To 2 No → Go To 3	All
2	Disconnect the Instrument Cluster C1 harness connector. Remove the ABS relay from the PDC. Using a 12-volt test light connected to 12-volts, check the ABS Warning Indicator Driver circuit. Does the test light illuminate? Yes → Repair the ABS Indicator circuit for a short to ground. Perform ABS VERIFICATION TEST - VER 1. No → Refer to symptom list for problems related to Instrument Cluster. Perform ABS VERIFICATION TEST - VER 1.	All
3	Install a substitute relay in place of the ABS relay. Perform the key-on bulb check. Does the ABS Warning Indicator operate OK? Yes → Replace the ABS relay. Perform ABS VERIFICATION TEST - VER 1. No → Go To 4	All
4	Remove the ABS relay from the PDC. Turn the ignition on. Using a 12-volt test light connected to ground, check the Fused B+ circuit. Does the test light illuminate? Yes → Go To 5 No → Repair the ABS relay Fused B+ circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All

***ABS WARNING INDICATOR ALWAYS ON — Continued**

TEST	ACTION	APPLICABILITY
5	<p>Remove the ABS relay. Disconnect the CAB harness connector. Measure the resistance of the ABS Relay Control circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Controller Antilock Brake. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Repair the ABS Relay Control circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All

Symptom:***ABS WARNING INDICATOR INOPERATIVE****POSSIBLE CAUSES**

INSTRUMENT CLUSTER CONCERN
 ABS RELAY STUCK
 ABS RELAY GROUND CIRCUIT OPEN
 ABS RELAY CONTROL CIRCUIT SHORT TO GROUND
 CAB INTERNAL SHORT TO GROUND
 ABS INDICATOR BULB OPEN
 ABS INDICATOR DRIVER OPEN
 INSTRUMENT CLUSTER INTERNAL OPEN

TEST	ACTION	APPLICABILITY
1	Perform the key-on bulb check. Do all bulbs check OK except for the ABS Warning Indicator? Yes → Go To 2 No → Refer to symptom list for problems related to Instrument Cluster. Perform ABS VERIFICATION TEST - VER 1.	All
2	Install a substitute relay in place of the ABS relay. Perform the key-on bulb check. Does the ABS Warning Indicator operate OK? Yes → Replace the ABS relay. Perform ABS VERIFICATION TEST - VER 1. No → Go To 3	All
3	Remove the ABS relay from PDC. Connect a jumper wire between the ABS Warning Indicator driver cavity of the ABS relay socket and ground. Key to RUN Does the ABS Indicator light? Yes → Go To 4 No → Go To 6	All
4	Remove the ABS relay from the PDC. Using a 12-volt test light connected to 12-volts, check the ABS relay ground circuit. Does the test light illuminate? Yes → Go To 5 No → Repair the ABS relay Ground circuit for an open. Perform ABS VERIFICATION TEST - VER 1.	All

*ABS WARNING INDICATOR INOPERATIVE — Continued

TEST	ACTION	APPLICABILITY
5	<p>Remove the ABS relay. Disconnect the CAB harness connector. Using a 12-volt test light connected to 12-volts, check the ABS Relay Control circuit. Does the test light illuminate?</p> <p>Yes → Repair the ABS Relay Control circuit for a short to ground. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Replace the Controller Antilock Brake. Perform ABS VERIFICATION TEST - VER 1.</p>	All
6	<p>Install a substitute bulb in place of the ABS Indicator bulb. Perform the key-on bulb check. Does the ABS bulb illuminate?</p> <p>Yes → Replace the ABS indicator bulb. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 7</p>	All
7	<p>Disconnect the Instrument Cluster C1 harness connector. Remove the ABS relay from the PDC. Measure the resistance of the ABS Indicator driver circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Instrument Cluster in accordance with the Service Information.. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Repair the ABS Indicator Driver circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All

Symptom:***BRAKE LAMP SWITCH****POSSIBLE CAUSES**

CHECK BRAKE LAMP SWITCH OUTPUT

BRAKE LAMP SWITCH B+ OPEN

BRAKE LAMP SWITCH OUTPUT CIRCUIT SHORT OR OPEN

BRAKE LAMP SWITCH OPEN

CAB -- INTERNAL OPEN

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII® in Inputs/Outputs, read the Brake Lamp Switch state. Press and release the brake pedal. Does the DRBIII® display PRESSED and RELEASED?</p> <p>Yes → The Brake Lamp Switch is OK. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 2</p>	All
2	<p>Disconnect the Brake Lamp Switch harness connector. Using a 12-volt test light connected to ground, check the Brake Lamp Switch Fused B+ circuit. Does the test light illuminate brightly ?</p> <p>Yes → Go To 3</p> <p>No → Repair the Brake Lamp Switch Fused B+ circuit for an open. Perform ABS VERIFICATION TEST - VER 1.</p>	All
3	<p>Disconnect the Brake Lamp Switch harness connector. Connect a jumper wire between the Brake Lamp Switch B+ and Output circuits. With the DRBIII® in Inputs/Outputs, read the Brake Lamp Switch state. Does the DRBIII® display PRESSED?</p> <p>Yes → Replace the Brake Lamp Switch in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Go To 4</p>	All
4	<p>Disconnect the CAB harness connector. Disconnect the Brake Lamp Switch harness connector. Check the Brake Lamp Switch Output circuit for a short to voltage and an open. Is the Brake Lamp Switch Output circuit shorted or open?</p> <p>Yes → Repair the Brake Lamp Switch Output circuit for a short to voltage or an open. Perform ABS VERIFICATION TEST - VER 1.</p> <p>No → Replace the Controller Anti-Lock Brake in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.</p>	All

Symptom:

*NO RESPONSE FROM CONTROLLER ANTILOCK BRAKE

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH THE PCM CHECK FUSE #25 IN JUNCTION BLOCK OPEN GROUND CIRCUITS OPEN FUSED IGNITION SWITCH OUTPUT CIRCUIT SCI TRANSMIT CIRCUIT OPEN CONTROLLER ANTILOCK BRAKE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB attempt to communicate with the PCM. Was the DRB able to communicate with the PCM? Yes → Go To 2 No → Refer to symptom list for problems related to No Response From PCM. Perform BODY VERIFICATION TEST - VER 1.	All
2	Turn the ignition off. Remove and inspect fuse #25 in the Junction Block. Is the fuse open? Yes → Refer to the wiring diagrams located in the service information to help isolate a possible short to ground. Perform BODY VERIFICATION TEST - VER 1. No → Go To 3	All
3	Turn the ignition off. Disconnect the CAB harness connector. Measure the resistance between ground and each ground circuit (cavs 8 and 24). Is the resistance below 5.0 ohms for each measurement? Yes → Go To 4 No → Repair the ground circuit that measured above 5.0 ohms for an open. Perform BODY VERIFICATION TEST - VER 1.	All
4	Turn the ignition off. NOTE: Ensure fuse #25 is installed in the Junction Block. Disconnect the CAB harness connector. Turn the ignition on. Measure the voltage of the Fused Ignition Switch Output circuit. Is the voltage above 10.0 volts? Yes → Go To 5 No → Repair the Fused Ignition Switch Output circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All

***NO RESPONSE FROM CONTROLLER ANTILOCK BRAKE — Continued**

TEST	ACTION	APPLICABILITY
5	Turn the ignition off. Disconnect the CAB harness connector. Measure the resistance of the SCI Transmit circuit between the CAB connector and the DLC. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the SCI Transmit circuit for an open. Perform BODY VERIFICATION TEST - VER 1.	All
6	If there are no possible causes remaining, view repair. Repair Replace the Controller Antilock Brake. Perform BODY VERIFICATION TEST - VER 1.	All

Verification Tests

ABS VERIFICATION TEST - VER 1	APPLICABILITY
<ol style="list-style-type: none"> 1. Turn the ignition off. 2. Connect all previously disconnected components and connectors. 3. Ensure all accessories are turned off and the battery is fully charged. 4. Ensure that the Ignition is on, and with the DRBIII, erase all Diagnostic Trouble Codes from ALL modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was malfunctioning. 5. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRBIII, read DTC's from ALL modules. 6. If any Diagnostic Trouble Codes are present, return to Symptom list and troubleshoot new or recurring symptom. 7. If there are no DTC's present after turning ignition on, road test the vehicle for at least 5 minutes. Perform several antilock braking stops. 8. Caution: Ensure braking capability is available before road testing. 9. Again, with the DRBIII® read DTC's. If any DTC's are present, return to Symptom list. 10. If there are no Diagnostic Trouble Codes (DTC's) present, and the customer's concern can no longer be duplicated, the repair is complete. <p>Are any DTC's present or is the original concern still present?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All

BODY VERIFICATION TEST - VER 1	APPLICABILITY
<ol style="list-style-type: none"> 1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors. 2. If the Sentry Key Immobilizer Module (SKIM) or the Powertrain Control Module (PCM) were replaced, proceed to number 4. If the SKIM or PCM were not replaced, continue to the next number. 3. If the Remote Keyless Entry module was replaced, using the DRBIII® select "Theft Alarm" "VTSS" "Miscellaneous" and "Program RKE". Program all transmitters used with this vehicle. Proceed to number 11. 4. Obtain the Vehicle's unique PIN number assigned to it's original SKIM module from either the vehicle's invoice or from Chrysler's Customer Center (1-800-992-1997). 5. With the DRBIII, select THEFT ALARM, SKIM, MISCELLANEOUS and select "Skim Module Replaced" function. Enter the 4 digit PIN number to put SKIM in "Access Mode". 6. The DRBIII will prompt you through the following steps. (1) Program the country code into the SKIM's memory. (2) Program the vehicle's VIN number into the SKIM's memory. (3) Transfer the vehicle's Secret Key data from the PCM. 7. Once secured access mode is active, the SKIM will remain in that mode for 60 seconds. 8. Using the DRBIII, program all customer keys into the SKIM's memory. This requires that the SKIM be in secured access mode, using the 4 digit code. 9. Note: If the PCM is replaced, the unique Secret Key data must be transferred from the SKIM to the PCM. This procedure requires the SKIM to be placed in secured access mode using the 4-digit code. 10. Note: If 3 attempts are made to enter secured access mode using an incorrect PIN, secured access mode will be locked out for 1 hour which causes the DRB III to display "Bus +\ - Signals Open". To exit this mode, turn ignition to the "Run" pos. for 1 hour. 11. Ensure all accessories are turned off and the battery is fully charged. 12. Ensure that the Ignition is on, and with the DRBIII®, erase all Diagnostic Trouble Codes from ALL modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was malfunctioning. 13. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the DRBIII®, read DTC's from ALL modules. <p>Are any DTC's present or is the original complaint still present?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All

NOTES

1.0 INTRODUCTION

The procedures contained in this manual include all the specifications, instructions, and graphics needed to diagnose engine control module (ECM), powertrain control module (PCM) and sentry key immobilizer module (SKIM) problems; they are no start, diagnostic trouble code, and no trouble code problems. The diagnostics in this manual are based on the trouble condition or symptom being present at the time of diagnosis.

When repairs are required, refer to the appropriate volume of the service manual for the proper removal and repair procedure.

Diagnostic procedures change every year. New diagnostic systems may be added; carryover systems may be enhanced. IT IS RECOMMENDED THAT YOU REVIEW THE ENTIRE MANUAL TO BECOME FAMILIAR WITH ALL NEW AND CHANGED DIAGNOSTIC PROCEDURES.

Please follow the recommendations below when choosing your diagnostic path.

1. First make sure the DRBIII® is communicating with the appropriate modules; ie., if the DRBIII® displays a "No Response" condition, you must diagnose this first before proceeding.
2. Read DTC's (diagnostic trouble codes) with the DRBIII®.
3. If no DTC's are present, identify the customer complaint.
4. Once the DTC or customer complaint is identified, locate the matching test in the Table of Contents and begin to diagnose the symptom.

All component location views are in Section 8.0. All connector pinouts are in Section 9.0. All system schematics are in Section 10.0.

An * placed before the symptom description indicates a no DTC customer complaint.

1.1 SYSTEM COVERAGE

This diagnostic procedures manual covers the 2001 XJ equipped with the 2.5L VM diesel engine.

1.2 SIX-STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the engine control module (ECM) and powertrain control module (PCM) is done in six basic steps:

- verification of complaint
- verification of any related symptoms
- symptom analysis
- problem isolation
- repair of isolated problem

- verification of proper operation

2.0 IDENTIFICATION OF SYSTEM

- LHD The ECM is located behind the lower instrument panel to the right of the accelerator pedal.
- RHD The ECM is located behind the lower instrument panel to the left of the clutch pedal.
- The PCM for both LHD and RHD is located in the engine compartment behind the air cleaner housing.

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

3.1 GENERAL DESCRIPTION

The 2.5L VM diesel engine system is equipped with the latest in technical advances. The on-board diagnostics incorporated with the powertrain control module and engine control module are intended to assist the field technician in repairing vehicle problems by the quickest means.

3.2 FUNCTIONAL OPERATION

3.2.1 PCM ON-BOARD DIAGNOSTICS

The PCM and ECM have been programmed to monitor many different circuits of the diesel fuel injection system. This monitoring is called "on-board diagnosis."

Certain criteria must be met for a trouble code to be entered into the PCM or ECM memory. The criteria may be a range of: engine rpm, engine temperature, and/or input voltage. If all of the criteria for monitoring a system or circuit are met and a problem is sensed, then a trouble code will be stored in the PCM or the ECM.

It is possible that a trouble code for a monitored circuit may not be entered into memory even though a malfunction has occurred. This may happen when the monitoring criteria have not been met.

The PCM and ECM compare input signal voltages from each input device with specifications (the established high and low limits of the range) that are programmed into it for that device. If the input voltage is not within specifications and other trouble code criteria are met, a trouble code will be stored in the PCM or ECM memory.

3.2.2 ECM OPERATING MODES

As input signals to the ECM change, the ECM adjusts its response to output devices. For example, the ECM must calculate a different fuel quantity and fuel timing for idle than it does for wide open throttle. There are several different modes of operation that determine how the ECM responds to the various input signals.

Ignition Switch On (Engine Off Mode)

When the ignition switch activates the diesel fuel injection system, the following actions occur:

1. The ECM determines atmospheric air pressure from the atmospheric pressure sensor located in the ECM.
2. The ECM energizes the fuel quantity actuator and the fuel shutdown solenoid if no faults are present.

If the engine is not started within 5 seconds of ignition on, the ECM deactivates the fuel quantity actuator and the fuel shutdown solenoid to prevent overheating.

Engine Start-up Mode - The ECM uses the engine temperature sensor, fuel temperature sensor, atmospheric pressure sensor, intake air temperature sensor and the engine speed sensor to determine fuel delivery during this mode.

Normal Driving Modes - Engine idle, warm-up, acceleration, deceleration and wide open throttle modes are all controlled based on the sensor inputs to the ECM and are modified based on engine temperature, boost pressure, intake air temperature and engine speed.

Overheat Protection Mode - If engine temperature becomes too hot, the ECM limits fuel quantity for engine protection.

Limp-In Modes - The ECM operates in limp-in mode when certain system faults are detected. The ECM operates in one of the following modes based on the type and severity of the fault:

1. 10% torque reduction.
2. 50% torque reduction.
3. Engine speed set to 1100 rpm.

After-Run - When fused ignition switch output is removed from the ECM cavity C1-47, the ECM performs a self-diagnostic check in the following order:

1. Electrical shut-off test.
2. Fuel quantity actuator test.
3. Monitoring module test.
4. Voltage regulator test.
5. Main relay test (if tests 1-4 pass).

If any of tests 1-4 fail, the fault is stored in memory and can be retrieved during the next ignition cycle using the DRBIII.

3.2.3 MONITORED CIRCUITS

The PCM and ECM are able to monitor and identify most driveability related trouble conditions. Some circuits are directly monitored through feedback circuitry. In addition, the PCM and ECM monitor the voltage state of some circuits and compare those states with expected values. Other systems are monitored indirectly when the PCM and ECM conduct a rationality test to identify problems.

Although most engine control subsystems are either directly or indirectly monitored, there may be occasions when diagnostic trouble codes are not immediately identified. For a trouble code to set, specific conditions must be met and unless these conditions are encountered, a code will not set.

3.2.4 SKIS ON-BOARD DIAGNOSTICS

The SKIS has been programmed to transmit and monitor many different coded messages as well as CCD Bus messages. This monitoring is called "On-Board Diagnosis".

Certain criteria must be met for a diagnostic trouble code to be entered in to the SKIS memory. The criteria may be a range of: input voltage, CCD Bus messages, or coded messages to the SKIS. If all of the criteria for monitoring a circuit or function are met and a fault is sensed, a diagnostic trouble code will be stored in the SKIS memory.

3.2.5 SKIS OVERVIEW

The Sentry Key Immobilizer System (SKIS) is an immobilizer system designed to prevent unauthorized vehicle operation. The system consists of a Sentry Key Immobilizer Module (SKIM), ignition key(s) equipped with a transponder chip, engine controller and powertrain controller. When the ignition switch is turned on, the SKIM interrogates the ignition key. If the ignition key is "Valid" the SKIM sends a CCD Bus message to the powertrain controller indicating the presence of a valid ignition key. The PCM then supplies the ECM with a valid immobilizer signal allowing the engine to continue to operate.

3.2.6 SKIS OPERATION

When ignition power is supplied to the SKIM, the SKIM performs an internal self-test. After the self-test is completed, the SKIM energizes the antenna (this activates the transponder chip) and sends a challenge to the transponder chip. The transponder chip responds to the challenge by generating an encrypted response message using the following:

Secret Key - This is an electronically stored value (identification number) that is unique to each SKIS.

The secret key is stored in the SKIM, PCM and all ignition key transponders.

Challenge - This is a random number that is generated by the SKIM at each ignition key cycle.

The secret key and challenge are the two variables used in the algorithm that produces the encrypted response message. The transponder uses the crypto algorithm to receive, decode and respond to the message sent by SKIM. After responding to the coded message, the transponder sends a transponder ID message to the SKIM. The SKIM compares the transponder ID to the available valid key codes in SKIM memory (8 key maximum). After validating the ignition key the SKIM sends a CCD Bus message called a "Seed Request" to the powertrain controller then waits for a powertrain controller response. If the powertrain controller does not respond, the SKIM will send the seed request again. After three failed attempts the SKIM will stop sending the seed request and store a trouble code. If the powertrain controller sends a seed response, the SKIM sends a valid/invalid key message to the powertrain controller. This is an encrypted message that is generated using the following:

VIN - Vehicle Identification Number

Seed - This is a random number that is generated by the PCM at each ignition key cycle.

The VIN and seed are the two variables used in the rolling code algorithm that encrypts the "valid/invalid key" message. The powertrain controller uses the rolling code algorithm to receive, decode and respond to the valid/invalid key message sent by SKIM. After sending the valid/invalid key message the SKIM waits 3.5 seconds for a PCM status message from the powertrain controller. If the PCM does not respond with a valid key message to the SKIM, a fault is detected and a trouble code stored.

The SKIS incorporates a SKIS indicator lamp located in the instrument cluster. The lamp is actuated when the SKIM sends a CCD Bus message to the electro/mechanical instrument cluster (MIC) requesting the lamp on. The MIC then provides the power and ground for the lamp. The SKIM will request lamp operation for the following:

- bulb check at ignition on
- to alert the vehicle operator to a SKIS malfunction

For all faults except transponder faults and VIN mismatch, the lamp remains on steady. In the event of a transponder fault the light flashes at the rate of 1Hz (once per second). If a fault is present the lamp will remain on or flashing for the complete ignition cycle. If a fault is stored in SKIM memory which

prevents the system from operating properly, the ECM will allow the engine to start and run (for 2 seconds) up to six times. After the sixth attempt, the ECM disables fuel delivery until the fault is corrected.

3.3 DIAGNOSTIC TROUBLE CODES

Each diagnostic trouble code is diagnosed by following a specific testing procedure. The diagnostic test procedures contain step-by-step instructions for determining the cause of trouble codes as well as no trouble code problems. It is not necessary to perform all of the tests in this book to diagnose an individual code.

Always begin by reading the diagnostic trouble codes using the DRBIII. This procedure begins in in DTC TEST - Checking the System for Diagnostic Trouble Codes. This will direct you to the specific test(s) that must be performed.

3.3.1 HARD CODE

A diagnostic trouble code that comes back within one cycle of the ignition key is a "hard" code. This means that the fault is there every time the powertrain control module/engine control module/sentry key immobilizer system (SKIS) checks that circuit or function. Procedures in this manual verify if the trouble code is a hard code at the beginning of each test. When it is not a hard code, an "intermittent" test must be performed.

3.3.2 INTERMITTENT CODE

A diagnostic trouble code that is not there every time the powertrain control module/engine control module/sentry key immobilizer system (SKIS) checks the circuit is an "intermittent" code. Most intermittent codes are caused by wiring or connector problems. Faults that come and go like this are the most difficult to diagnose; they must be looked for under specific conditions that cause them. The following checks may assist you in identifying a possible intermittent problem:

- Visually inspect related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.
- Visually inspect the related harnesses. Look for chafed, pierced, or partially broken wire.
- Refer to any hotlines or technical service bulletins that may apply.

NOTE: Electro-magnetic (Radio) interference can cause intermittent system malfunction.

 VEHICLE THEFT ALARM INVALID SKIM MESSAGE

3.3.5 HANDLING NO TROUBLE CODE PROBLEMS

After reading Section 3.0 (System Description and Functional Operation), you should have a better understanding of the theory and operation of the on-board diagnostics, and how this relates to the diagnosis of a vehicle that may have a driveability-related symptom or complaint.

3.4 USING THE DRBIII®

Refer to the DRBIII user's guide for instructions and assistance with reading trouble codes, erasing trouble codes, and other DRBIII functions.

3.5 DRBIII® ERROR MESSAGES AND BLANK SCREEN

Under normal operation, the DRBIII will display one of only two error messages:

- User-Requested WARM Boot or User-Requested COLD Boot

This is a sample of such an error message display:

```
ver: 2.14
date: 26 Jul93
file: key—itf.cc
date: Jul 26 1993
line: 548
err: 0x1
User-Requested COLD Boot
```

Press MORE to switch between this display and the application screen.
 Press F4 when done noting information.

3.5.1 DRBIII® DOES NOT POWER UP

If the LEDs do not light or no sound is emitted at start up, check for loose cable connections or a bad cable. Check the vehicle battery voltage (data link connector cavity 16). A minimum of 11 volts at DLC cavity 16 is required to adequately power the DRBIII. Check for proper ground connection at DLC cavities 4 and 5.

If all connections are proper between the DRBIII and the vehicle or other devices, and the vehicle battery is fully charged, an inoperative DRBIII may be the result of a faulty cable or vehicle wiring. For a blank screen, refer to the appropriate body diagnostics manual.

3.5.2 DISPLAY IS NOT VISIBLE

Low temperatures will affect the visibility of the display. Adjust the contrast to compensate for this condition.

80b57566

GENERAL INFORMATION

4.0 DISCLAIMERS, SAFETY, WARNINGS

4.1 DISCLAIMERS

All information, illustrations, and specifications contained in this manual are based on the latest information available at the time of publication. The right is reserved to make changes at any time without notice.

4.2 SAFETY

4.2.1 TECHNICIAN SAFETY INFORMATION

WARNING: ENGINES PRODUCE CARBON MONOXIDE THAT IS ODORLESS, CAUSES SLOWER REACTION TIME, AND CAN LEAD TO SERIOUS INJURY. WHEN THE ENGINE IS OPERATING, KEEP SERVICE AREAS WELL VENTILATED OR ATTACH THE VEHICLE EXHAUST SYSTEM TO THE SHOP EXHAUST REMOVAL SYSTEM.

Set the parking brake and block the wheels before testing or repairing the vehicle. It is especially important to block the wheels on front-wheel drive vehicles; the parking brake does not hold the drive wheels.

When servicing a vehicle, always wear eye protection, and remove any metal jewelry such as watchbands or bracelets that might make an inadvertent electrical contact.

When diagnosing a powertrain system problem, it is important to follow approved procedures where applicable. These procedures can be found in the service manual procedures. Following these procedures is very important to the safety of individuals performing diagnostic tests.

4.2.2 VEHICLE PREPARATION FOR TESTING

Make sure the vehicle being tested has a fully charged battery. If it does not, false diagnostic codes or error messages may occur.

4.2.3 SERVICING SUB-ASSEMBLIES

Some components of the powertrain system are intended to be serviced in assembly only. Attempting to remove or repair certain system sub-components may result in personal injury and/or improper system operation. Only those components with approved repair and installation procedures in the service manual should be serviced.

4.2.4 DRBIII® SAFETY INFORMATION

WARNING: EXCEEDING THE LIMITS OF THE DRBIII® MULTIMETER IS DANGEROUS. IT CAN EXPOSE YOU TO SERIOUS OR POSSIBLY FATAL INJURY. CAREFULLY READ AND UNDERSTAND THE CAUTIONS AND THE SPECIFICATION LIMITS.

Follow the vehicle manufacturer's service specifications at all times.

- Do not use the DRBIII if it has been damaged.
- Do not use the test leads if the insulation is damaged or if metal is exposed.
- To avoid electrical shock, do not touch the test leads, tips, or the circuit being tested.
- Choose the proper range and function for the measurement. Do not try voltage or current measurements that may exceed the rated capacity.
- Do not exceed the limits shown in the table below:

FUNCTION	INPUT LIMIT
Volts	0 - 500 peak volts AC 0 - 500 volts DC
Ohms (resistance)*	0 - 1.12 megohms
Frequency Measured Frequency Generated	0 - 10 kHz
Temperature	-58 - 1100F -50 - 600C

* Ohms cannot be measured if voltage is present. Ohms can be measured only in a non-powered circuit.

- Voltage between any terminal and ground must not exceed 500v DC or 500v peak AC.
- Use caution when measuring voltage above 25v DC or 25v AC.
- The circuit being tested must be protected by a 10A fuse or circuit breaker.
- Use the low current shunt to measure circuits up to 10A. Use the high current clamp to measure circuits exceeding 10A.
- When testing for the presence of voltage or current, make sure the meter is functioning correctly. Take a reading of a known voltage or current before accepting a zero reading.
- When measuring current, connect the meter in series with the load.
- Disconnect the live test lead before disconnecting the common test lead.

4.3 WARNINGS

4.3.1 VEHICLE DAMAGE WARNINGS

Before disconnecting any control module, make sure the ignition is "off". Failure to do so could damage the module.

When testing voltage or continuity at any control module, use the terminal side (not the wire end) of the connector. Do not probe a wire through the insulation; this will damage it and eventually cause it to fail because of corrosion.

Be careful when performing electrical tests so as to prevent accidental shorting of terminals. Such mistakes can damage fuses or components. Also, a second code could be set, making diagnosis of the original problem more difficult.

4.3.2 ROAD TESTING A COMPLAINT VEHICLE

Some complaints will require a test drive as part of the repair verification procedure. The purpose of the test drive is to try to duplicate the diagnostic code or symptom condition.

CAUTION: BEFORE ROAD TESTING A VEHICLE, BE SURE THAT ALL COMPONENTS ARE REASSEMBLED. DURING THE TEST DRIVE, DO NOT TRY TO READ THE DRBIII® SCREEN WHILE IN MOTION. DO NOT HANG THE DRBIII® FROM THE REAR VIEW MIRROR OR OPERATE IT YOURSELF. HAVE AN ASSISTANT AVAILABLE TO OPERATE THE DRBIII®.

5.0 REQUIRED TOOLS AND EQUIPMENT

ammeter
DRBIII® (diagnostic read-out box) scan tool
high impedance 12-volt test light
jumper wires and probes
ohmmeter
vacuum gauge
voltmeter

6.0 GLOSSARY OF TERMS

backfire, popback	fuel ignites in either the intake or the exhaust system
cuts out, misses	a steady pulsation or the inability of the engine to maintain a consistent rpm
DLC	data link connector (previously called "engine diagnostic connector")
detonation, pre-ignition	a mild to severe ping, especially under loaded engine conditions
ECM	engine control module (Bosch EDC15)
ECT	engine coolant temperature sensor
EGR	exhaust gas recirculation valve and system
EVM	electric vacuum modulator
generator	previously called "alternator"
hard start	The engine takes longer than usual to start, even though it is able to crank normally.
hesitation, sag, stumble	There is a momentary lack of response when the throttle is opened. This can occur at all vehicle speeds. If it is severe enough, the engine may stall.
lack of power, sluggish	The engine has less than expected power, with little or no increase in vehicle speed when the throttle is opened.
MIC	electro/mechanical instrument cluster
MIL	malfunction indicator lamp
PCM	powertrain control module (JTEC+)
PDC	power distribution center
poor fuel economy	There is significantly less fuel mileage than other vehicles of the same design and configuration.

GENERAL INFORMATION

rough, unstable, or erratic idle, stalling The engine runs unevenly at idle and causes the engine to shake if it is severe enough. The engine idle rpm may vary (called “hunting”). This condition may cause stalling if it is severe enough.

SKIM sentry key immobilizer module

SKIS sentry key immobilizer system

start & stall The engine starts but immediately dies.

surge engine rpm fluctuation without corresponding change in throttle position sensor

VSS vehicle speed sensor

7.0

DIAGNOSTIC INFORMATION AND PROCEDURES

Symptom:

P0622-GENERATOR FIELD NOT SWITCHING PROPERLY - DIESEL

When Monitored and Set Condition:

P0622-GENERATOR FIELD NOT SWITCHING PROPERLY - DIESEL

When Monitored: With the engine speed greater than 1500 RPM for at least 25 seconds.

Set Condition: When the PCM tries to regulate the generator output with no result during monitoring.

POSSIBLE CAUSES

INTERMITTENT CONDITION

CHECK FOR OTHER CHARGING SYSTEM DTCS

GENERATOR FIELD CIRCUIT OPEN

GENERATOR SOURCE CIRCUIT OPEN

POWERTRAIN CONTROL MODULE (INTERNAL DRIVER FAULT)

GENERATOR (FIELD OPEN)

POWERTRAIN CONTROL MODULE (GENERATOR SOURCE OPEN)

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, read PCM DTCs. Are there any other Charging System related DTCs? Yes → Refer to the symptom list for the related symptom(s). Perform CHARGING VERIFICATION - VER-3. No → Go To 2	All
2	NOTE: The battery must be fully charged and the generator belt must be in good condition and tensioned properly before continuing. Turn the ignition on. With the DRB, erase PCM DTCs. Turn the ignition off for 10 seconds, then start the engine. With the DRB, read PCM DTCs. Did this DTC reset? Yes → Go To 3 No → Go To 7	All
3	Turn the ignition off, then on. Measure the voltage of the Generator Field Driver circuit in PCM harness connector C2 by back probing. Is the voltage above 10.0 volts? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform CHARGING VERIFICATION - VER-3. No → Go To 4	All

P0622-GENERATOR FIELD NOT SWITCHING PROPERLY - DIESEL — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Generator Field harness connector. Turn the ignition on. Measure the voltage of the Generator Source circuit. Is the voltage above 10.0 volts? Yes → Go To 5 No → Go To 6	All
5	Turn the ignition off. Disconnect the Generator Field harness connector. Disconnect the PCM harness connectors. Measure the resistance of the Generator Field circuit. Is the resistance below 5.0 ohms? Yes → Replace the Generator. Perform CHARGING VERIFICATION - VER-3. No → Repair the Generator Field circuit for an open. Perform CHARGING VERIFICATION - VER-3.	All
6	Turn the ignition off. Disconnect the Generator Field harness connector. Disconnect the PCM harness connectors. Measure the resistance of the Generator Source circuit. Is the resistance below 5.0 ohms? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform CHARGING VERIFICATION - VER-3. No → Repair the Generator Source circuit for an open. Perform CHARGING VERIFICATION - VER-3.	All
7	WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS. NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition. With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform CHARGING VERIFICATION - VER-3. No → Test Complete.	All

Symptom:

P1492-AMBIENT/BATT TEMP SEN VOLTS TOO HIGH - DIESEL

When Monitored and Set Condition:

P1492-AMBIENT/BATT TEMP SEN VOLTS TOO HIGH - DIESEL

When Monitored: With the ignition on.

Set Condition: The PCM detects voltage on the ambient/battery temperature sensor signal circuit above 4.94 volts for more than 3 seconds.

POSSIBLE CAUSES

POWERTRAIN CONTROL MODULE (SHORTED TO VOLTAGE INTERNALLY)

INTERMITTENT CONDITION

AMB/BATT TEMP SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

AMBIENT/BATTERY TEMPERATURE SENSOR

AMBIENT/BATTERY TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN

AMBIENT/BATTERY TEMPERATURE SENSOR GROUND CIRCUIT OPEN

POWERTRAIN CONTROL MODULE (OPEN INTERNALLY)

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, erase PCM DTCs. Cycle the ignition on for five seconds, then off for five seconds, several times. With the DRB, read PCM DTCs. Did this DTC reset? Yes → Go To 2 No → Go To 8	All
2	Turn the ignition off. Disconnect the Ambient/Battery Temperature Sensor harness connector. Turn the ignition on. Measure the voltage between ground and the Ambient/Battery Temperature Sensor Signal circuit. Is the voltage above 5.5 volts? Yes → Go To 3 No → Go To 4	All

P1492-AMBIENT/BATT TEMP SEN VOLTS TOO HIGH - DIESEL — **Continued**

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Ambient/Battery Temperature Sensor harness connector. Disconnect the PCM harness connectors. Remove the ASD/Diesel Power Relay from the PDC. Connect a jumper wire between cavity 30 and cavity 87 of the ASD/Diesel Power Relay connector. Turn the ignition on. Measure the voltage between ground and the Amb/Batt Temp Sensor Signal circuit. Is the voltage below 0.5 volt?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform CHARGING VERIFICATION - VER-3.</p> <p>No → Repair the Ambient/Battery Temperature Sensor Signal circuit for a short to voltage. Perform CHARGING VERIFICATION - VER-3.</p>	All
4	<p>Turn the ignition off. Disconnect the Ambient/Battery Temperature Sensor harness connector. Measure the resistance of the Amb/Batt Temp Sensor. Is the resistance above 100 kohms?</p> <p>Yes → Replace the Ambient/Battery Temperature Sensor. Perform CHARGING VERIFICATION - VER-3.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the Ambient/Battery Temperature Sensor harness connector. Disconnect the PCM harness connectors. Measure the resistance of the Amb/Batt Temp Sensor Signal circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 6</p> <p>No → Repair the Ambient/Battery Temperature Sensor Signal circuit for an open. Perform CHARGING VERIFICATION - VER-3.</p>	All
6	<p>Turn the ignition off. Disconnect the Ambient/Battery Temperature Sensor harness connector. Disconnect the PCM harness connectors. Measure the resistance of the Amb/Batt Temp Sensor Ground circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 7</p> <p>No → Repair the Ambient/Battery Temperature Sensor Ground circuit for an open. Perform CHARGING VERIFICATION - VER-3.</p>	All
7	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module in accordance with the Service Information. Perform CHARGING VERIFICATION - VER-3.</p>	All

P1492-AMBIENT/BATT TEMP SEN VOLTS TOO HIGH - DIESEL —
Continued

TEST	ACTION	APPLICABILITY
8	<p>WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS.</p> <p>NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.</p> <p>With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set.</p> <p>Review the DTC When Monitored and Set Conditions. Symptom:**P1600-BATTERY VOLTAGE SRC HIGH EXCEEDED - DIESEL****When Monitored and Set Condition:****P1600-BATTERY VOLTAGE SRC HIGH EXCEEDED - DIESEL**

When Monitored: With the ignition on.

Set Condition: The ECM detects the system voltage has exceeded 20 volts for at least 5 seconds.

POSSIBLE CAUSES

CHECK THE CHARGING VOLTAGE AT 2000 RPM

CLEAR THE DTC AND RETEST

INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	Start the engine. Set the engine speed to 2000 RPM. Measure the voltage at the battery. Is the voltage above 17.0 volts? Yes → Refer to symptom list for problems related to the charging system. Perform CHARGING VERIFICATION - VER-3. No → Go To 2	All
2	Turn the ignition on. With the DRB, erase ECM DTCs. Start the engine and vary the engine speed between idle and 2500 RPM for several minutes.. With the DRB, read ECM DTCs. Did this DTC reset? Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform CHARGING VERIFICATION - VER-3. No → Go To 3	All

P1600-BATTERY VOLTAGE SRC HIGH EXCEEDED - DIESEL — Continued

TEST	ACTION	APPLICABILITY
3	<p>WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS.</p> <p>NOTE: The conditions that set the DTC are not present at this time. Symptom List:**P1682-CHARGING SYSTEM VOLTAGE TOO LOW - DIESEL*****CHECKING THE CHARGING SYSTEM OPERATION - DIESEL**

Test Note: All symptoms listed above are diagnosed using the same tests.
 The title for the tests will be **P1682-CHARGING SYSTEM VOLTAGE TOO LOW - DIESEL.**

When Monitored and Set Condition:**P1682-CHARGING SYSTEM VOLTAGE TOO LOW - DIESEL**

When Monitored: With the engine running.

Set Condition: The voltage at PCM cavity C1-22 is 0.5 volt or more below the target charging voltage for at least 3 seconds.

POSSIBLE CAUSES

CHECK FOR CYCLING VOLTAGE ON THE GENERATOR FIELD DRIVER CIRCUIT
 INTERMITTENT CONDITION
 GENERATOR BELT CONDITION OR TENSION
 HIGH RESISTANCE IN THE FUSED B+ CIRCUIT TO THE PCM
 GENERATOR FIELD DRIVER CIRCUIT SHORTED TO VOLTAGE
 GENERATOR FUSED B+ CIRCUIT HIGH RESISTANCE
 ASD RELAY OUTPUT CIRCUIT OPEN
 GENERATOR GROUND CIRCUIT HIGH RESISTANCE
 GENERATOR FIELD DRIVER CIRCUIT OPEN
 POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	NOTE: Inspect the vehicle for aftermarket accessories that may exceed the Generator capacity. NOTE: The battery must be fully charged before continuing. Inspect the generator belt condition and tension. Is the generator belt in good condition and tensioned properly? Yes → Go To 2 No → Repair as necessary. Perform CHARGING VERIFICATION - VER-3.	All

P1682-CHARGING SYSTEM VOLTAGE TOO LOW - DIESEL — Continued

TEST	ACTION	APPLICABILITY
2	<p>Turn the ignition on. With the DRB, actuate the Generator Field. Measure the voltage between ground and the Generator Field Driver circuit by back probing the Generator Field harness connector with a voltmeter. NOTE: The voltage should cycle from Battery voltage to below 2.0 volts every 1.4 seconds. While monitoring the voltmeter, wiggle the generator field harness and connectors between the generator, PCM and the ASD/Diesel Power Relay (in the PDC). Was there any interruption of the normal voltage cycling?</p> <p>Yes → Repair the harness as necessary where the wiggling caused the interruption. Perform CHARGING VERIFICATION - VER-3.</p> <p>No → Go To 3</p> <p>NOTE: With the DRB, stop the Generator Field actuation.</p>	All
3	<p>Connect the positive lead of a voltmeter to the generator B+ (12V) terminal and the negative lead to the battery positive (+) post. WARNING: KEEP EVERYTHING CLEAR OF THE ENGINE'S MOVING PARTS. Start the engine. Is the voltage on the voltmeter below 0.4 volt?</p> <p>Yes → Go To 4</p> <p>No → Repair the Generator Fused B+ circuit for high resistance. Perform CHARGING VERIFICATION - VER-3.</p>	All
4	<p>Connect the positive lead of a voltmeter to the generator case (housing) and the negative lead to the battery negative (-) post. WARNING: KEEP EVERYTHING CLEAR OF THE ENGINE'S MOVING PARTS. Start the engine. Is the voltage on the voltmeter below 0.4 volt?</p> <p>Yes → Go To 5</p> <p>No → Repair the Generator Ground circuit for high resistance. Perform CHARGING VERIFICATION - VER-3.</p>	All
5	<p>Turn the ignition off, then on. With the DRB, read and record the Battery Voltage. With a voltmeter, measure and record the voltage between the Battery terminals. Compare the DRB Battery Voltage reading to the voltmeter reading. Is the difference between the two readings less than 0.5 volt?</p> <p>Yes → Go To 6</p> <p>No → Go To 7</p>	All

P1682-CHARGING SYSTEM VOLTAGE TOO LOW - DIESEL — Continued

TEST	ACTION	APPLICABILITY
6	<p>WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS.</p> <p>NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.</p> <p>With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set.</p> <p>Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set.</p> <p>Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Were any of the above conditions present?</p> <p>Yes → Repair as necessary Perform CHARGING VERIFICATION - VER-3.</p> <p>No → Test Complete.</p>	All
7	<p>Turn the ignition off.</p> <p>With a voltmeter, measure and record the voltage between the Battery terminals. Disconnect the PCM harness connectors.</p> <p>Measure the voltage of the Fused B+ circuit in the PCM C1 harness connector. Are the voltage measurements within 0.5 volt of each other?</p> <p>Yes → Go To 8</p> <p>No → Repair the Fused B+ circuit to the Powertrain Control Module for high resistance. Perform CHARGING VERIFICATION - VER-3.</p>	All
8	<p>Turn the ignition off.</p> <p>Disconnect the PCM harness connectors.</p> <p>Disconnect the Generator Field harness connector.</p> <p>Turn the ignition on.</p> <p>Measure the voltage of the Generator Field Driver circuit.</p> <p>Is the voltage below 0.5 volt?</p> <p>Yes → Go To 9</p> <p>No → Repair the Generator Field Driver circuit for a short to voltage. Perform CHARGING VERIFICATION - VER-3.</p>	All
9	<p>Turn the ignition off.</p> <p>Disconnect the PCM harness connectors.</p> <p>Turn the ignition on.</p> <p>Measure the voltage of the ASD Relay Output circuit in PCM harness connector C3, cavity 12.</p> <p>Is the voltage above 10.0 volts?</p> <p>Yes → Go To 10</p> <p>No → Repair the ASD Relay Output circuit for an open. Perform CHARGING VERIFICATION - VER-3.</p>	All

P1682-CHARGING SYSTEM VOLTAGE TOO LOW - DIESEL — Continued

TEST	ACTION	APPLICABILITY
10	Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the Generator Field harness connector. Measure the resistance of the Generator Field Driver circuit. Is the resistance below 5.0 ohms? Yes → Go To 11 No → Repair the Generator Field Driver circuit for an open. Perform CHARGING VERIFICATION - VER-3.	All
11	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform CHARGING VERIFICATION - VER-3.	All

Symptom:

P-1685 INVALID SKIM KEY

When Monitored and Set Condition:

P-1685 INVALID SKIM KEY

When Monitored: With the ignition on.

Set Condition: The PCM does not receive a valid key message from the SKIM.

POSSIBLE CAUSES

INCORRECT VIN IN PCM
INVALID SKIM KEY NOT PRESENT
NO COMMUNICATION WITH SKIM
NO VIN PROGRAMMED IN THE PCM
PCM
SKIM TROUBLE CODES SET

TEST	ACTION	APPLICABILITY
1	<p>With the DRB III, read the PCM DTCs. Look for P1685. Turn the ignition on. Is the Starts Since Set counter for DTC P1685 displayed and equal to 0?</p> <p>Yes → Go To 2 No → Go To 7</p>	All
2	<p>Turn the ignition on. With the DRB III, attempt to communicate with the SKIM. Can you communicate with the SKIM?</p> <p>Yes → Go To 3 No → Refer to symptom BUS +/- SIGNAL OPEN FROM SKIM in the COMMUNICATION category. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
3	<p>Turn the ignition on. With the DRB III, check for SKIM DTC's. Are there any trouble codes set in the SKIM?</p> <p>Yes → Repair all SKIM DTC's. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 4</p>	All

P-1685 INVALID SKIM KEY — Continued

TEST	ACTION	APPLICABILITY
4	<p>NOTE: If a VIN has not been programmed into the PCM, program VIN into the PCM and retest.</p> <p>Turn the ignition on.</p> <p>With the DRB III, display the VIN that is programmed in the PCM.</p> <p>Is there a VIN programmed in the PCM?</p> <p>Yes → Go To 5</p> <p>No → Program the correct VIN into the PCM and retest.</p> <p>Perform ROAD TEST VERIFICATION - VER-2.</p>	All
5	<p>Turn the ignition on.</p> <p>With the DRB III, display the VIN that is programmed in the PCM.</p> <p>Is the correct VIN programmed in the PCM?</p> <p>Yes → Go To 6</p> <p>No → Replace and program the PCM in accordance with the Service Information.</p> <p>Perform ROAD TEST VERIFICATION - VER-2.</p>	All
6	<p>Turn the ignition off.</p> <p>Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information.</p> <p>Turn the ignition on.</p> <p>With the DRB III, erase all DTCs.</p> <p>Attempt to start and idle the engine.</p> <p>With the DRB III, read the PCM DTCs.</p> <p>Does the DRB III display this code?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information.</p> <p>Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Test Complete.</p>	All
7	<p>NOTE: This DTC could have been set if the SKIM harness connector was disconnected, or if the SKIM was replaced recently.</p> <p>NOTE: All keys that the customer uses for this vehicle must be tested to verify they are operating properly.</p> <p>Verify the correct VIN is programmed in both the PCM and SKIM modules.</p> <p>Turn the ignition off.</p> <p>With the next customer key turn the ignition key on and crank the engine to start.</p> <p>With the DRB III, read the PCM DTCs. Look for P1685</p> <p>Is the Starts Since Set Counter for DTC P1685 displayed and equal to 0?</p> <p>Yes → Replace the Ignition Key.</p> <p>Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Test Complete.</p> <p>NOTE: If this DTC can not be reset, it may have been an actual theft attempt.</p>	All

Symptom:

P-1686 NO SKIM BUS MESSAGE RECEIVED

When Monitored and Set Condition:

P-1686 NO SKIM BUS MESSAGE RECEIVED

When Monitored: With the ignition on.

Set Condition: The PCM does not receive a CCD Bus message from the SKIM when expected.

POSSIBLE CAUSES

PCM
INTERMITTENT CONDITION
CCD BUS CIRCUIT(S) OPEN FROM PCM TO SKIM
LOSS OF SKIM COMMUNICATION

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB III, read PCM DTCs. LOOK for P1686. Is the Starts Since Set counter for DTC P1686 displayed and equal to 0? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition on. With the DRB III, attempt to communicate with the SKIM. With the DRB III, select Theft Alarm and read the SKIM DTCs. NOTE: This test will indicate if the Bus is operational from the DLC to the SKIM. Can the DRB communicate with the SKIM? Yes → Go To 3 No → Refer to the appropriate symptom in the COMMUNICATION category. Perform ROAD TEST VERIFICATION - VER-2.	All
3	Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the SKIM harness connector. Measure the resistance of both CCD Bus circuits between the PCM and the SKIM. Is the resistance below 5.0 ohms for each measurement? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Repair the CCD Bus circuit(s) for an open. Perform ROAD TEST VERIFICATION - VER-2.	All

P-1686 NO SKIM BUS MESSAGE RECEIVED — Continued

TEST	ACTION	APPLICABILITY
4	<p>WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS.</p> <p>NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.</p> <p>With the engine running and at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set.</p> <p>Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set.</p> <p>Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Were any of the above conditions present?</p> <p>Yes → Repair as necessary Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Test Complete.</p>	All

Symptom List:

P0600-PCM FAILURE SPI COMMUNICATIONS - DIESEL
P0601-PCM INTERNAL CONTROLLER FAILURE - DIESEL
P1696-PCM FAILURE EEPROM WRITE DENIED

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be P0600-PCM FAILURE SPI
COMMUNICATIONS - DIESEL.

POSSIBLE CAUSES

POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>NOTE: This DTC indicates an internal PCM problem.</p> <p>View repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module in accordance with the Service Information.</p> <p>Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:

P1687-NO CLUSTER BUS MESSAGE - DIESEL

When Monitored and Set Condition:

P1687-NO CLUSTER BUS MESSAGE - DIESEL

When Monitored: With the ignition on.

Set Condition: The PCM has not received an expected Cluster Status Bus message from the instrument cluster within the last 20 seconds.

POSSIBLE CAUSES

CCD BUS CIRCUIT(S) OPEN
CHECKING CLUSTER COMMUNICATION
PCM - INTERNAL FAILURE
INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB III, erase PCM DTCs. Cycle the ignition key on and off several times, leaving the key on for at least 10 seconds at a time. With the DRB III, read PCM DTCs. Did this DTC reset? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition on. With the DRB III, attempt to communicate with the instrument cluster. Can the DRB communicate with the instrument cluster? Yes → Go To 3 No → Refer to COMMUNICATION for the related symptom(s). Perform ROAD TEST VERIFICATION - VER-2.	All
3	Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the instrument cluster harness connector. Measure the resistance of both CCD Bus circuits between the PCM and the instrument cluster. Is the resistance below 5.0 ohms for both measurements? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Repair the CCD Bus circuit(s) that measured above 5.0 ohms for an open. Perform ROAD TEST VERIFICATION - VER-2.	All

POSSIBLE CAUSES

INTERMITTENT CONDITION

FUEL TEMPERATURE SENSOR (FUEL INJECTION PUMP) SHORTED TO GROUND INTERNALLY

FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

FUEL TEMPERATURE SENSOR SIGNAL AND GROUND CIRCUITS SHORTED TOGETHER

INTERNAL FUEL INJECTION PUMP TEST

ENGINE CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, erase ECM DTCs. Turn the ignition off, wait 10 seconds, then turn the ignition on. With the DRB, read ECM DTCs. Did this DTC reset? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Disconnect the Fuel Injection Pump harness connector. Turn the ignition on. With the DRB, erase ECM DTCs and then read ECM DTCs. Did DTC P0180 FUEL TEMPERATURE SENSOR SRC HIGH EXCEEDED set? Yes → Replace the Fuel Injection Pump in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 3	All

P0180-FUEL TEMPERATURE SENSOR SRC LOW EXCEEDED — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the Fuel Injection Pump harness connector. Measure the resistance between ground and the Fuel Temperature Sensor Signal circuit. Is the resistance above 100 kohms?</p> <p>Yes → Go To 4</p> <p>No → Repair the Fuel Temperature Sensor Signal circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
4	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the Fuel Injection Pump harness connector. Measure the resistance between the Fuel Temperature Sensor Signal circuit and Sensor Ground circuit. Is the resistance above 100 kohms?</p> <p>Yes → Go To 5</p> <p>No → Repair the Fuel Temperature Sensor Signal and Ground circuits for a short together. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
5	<p>Disconnect the Fuel Injection Pump harness connector. Measure the resistance between the following cavities in the Fuel Injection Pump connector (fuel pump side): Cavity 1 to cavities 4, 5, 6, 7, 8, 9, and 10. Cavity 4 to cavities 5, 6, 7, 8, 9, and 10. Cavity 5 to cavities 6, 7, 8, and 9. Cavity 7 to cavities 6, 8, 9, and 10. Cavity 8 to cavities 6 and 10. NOTE: The resistance should be above 100 ohms for all measurements. Is the resistance above 100 ohms for each of the measurements?</p> <p>Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Replace the Fuel Injection Pump in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

P0180-FUEL TEMPERATURE SENSOR SRC LOW EXCEEDED — Continued

TEST	ACTION	APPLICABILITY
6	<p>WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS.</p> <p>NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.</p> <p>With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set.</p> <p>Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set.</p> <p>Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Visually inspect the related wiring harness. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Were any of the above conditions present?</p> <p>Yes → Repair as necessary Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Test Complete.</p>	All

Symptom:**P0235-TURBOCHARGER BOOST SENSOR PLAUSIBILITY****When Monitored and Set Condition:****P0235-TURBOCHARGER BOOST SENSOR PLAUSIBILITY**

When Monitored: With the engine speed between 600 and 870 RPM.

Set Condition: When the engine is idling, the turbocharger boost pressure sensor input does not agree with the atmospheric pressure sensor input for at least 7 seconds.

POSSIBLE CAUSES

INTERMITTENT CONDITION

HIGH RESISTANCE IN THE BOOST PRESSURE SENSOR SIGNAL CIRCUIT

HIGH RESISTANCE IN THE BOOST PRESSURE SENSOR GROUND CIRCUIT

HIGH RESISTANCE IN THE 5-VOLT SUPPLY CIRCUIT

TURBOCHARGER BOOST PRESSURE/INTAKE AIR TEMPERATURE SENSOR

ENGINE CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, erase ECM DTCs. Turn the ignition off, wait 30 seconds, then start and idle the engine for at least 30 seconds. NOTE: Engine idle speed must be below 870 RPM. With the DRB, read ECM DTCs. Did this DTC reset? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Disconnect the Turbocharger Boost Pressure/IAT Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance of the Boost Pressure Sensor Signal circuit. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the Boost Pressure Sensor Signal circuit for high resistance. Perform ROAD TEST VERIFICATION - VER-2.	All

P0235-TURBOCHARGER BOOST SENSOR PLAUSIBILITY — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Turbocharger Boost Pressure/IAT Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance of the Sensor Ground circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 4</p> <p>No → Repair the Boost Pressure Sensor Ground circuit for high resistance. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
4	<p>Turn the ignition off. Disconnect the Turbocharger Boost Pressure/IAT Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance of the 5-volt Supply circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 5</p> <p>No → Repair the 5-volt Supply circuit for high resistance. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
5	<p>Turn the ignition off. Replace the Turbocharger Boost Pressure/Intake Air Temperature Sensor. Turn the ignition on. With the DRB, erase ECM DTCs. Test drive the vehicle, pausing several times to cycle the ignition. Monitor the DRB for ECM DTCs. Did this DTC reset?</p> <p>Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → The repair is complete. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
6	<p>WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS. NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition. With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present?</p> <p>Yes → Repair as necessary Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Test Complete.</p>	All

Symptom:**P0235-TURBOCHARGER BOOST SENSOR SIGNAL HIGH EXCEEDED****When Monitored and Set Condition:****P0235-TURBOCHARGER BOOST SENSOR SIGNAL HIGH EXCEEDED**

When Monitored: With the ignition on.

Set Condition: The turbocharger boost pressure sensor signal voltage exceeds 4.80 volts for at least 2 seconds.

POSSIBLE CAUSES

INTERMITTENT CONDITION

5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

BOOST PRESSURE SENSOR GROUND CIRCUIT OPEN

BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

TURBOCHARGER BOOST PRESSURE/INTAKE AIR TEMPERATURE SENSOR

POOR CONNECTOR TERMINAL CONTACT

ENGINE CONTROL MODULE (5-VOLT SUPPLY SHORTED TO VOLTAGE)

ENGINE CONTROL MODULE (INTERNAL)

ENGINE CONTROL MODULE (SENSOR SIGNAL SHORTED TO VOLTAGE)

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, read the Turbocharger Boost Pressure Sensor voltage. Is the voltage above 4.5 volts? Yes → Go To 2 No → Go To 9	All
2	Turn the ignition off. Disconnect the Turbocharger Boost Pressure/IAT Sensor harness connector. Turn the ignition on. Measure the voltage between ground and the Turbocharger Boost Pressure Sensor 5-volt Supply circuit. Is the voltage above 5.2 volts? Yes → Go To 3 No → Go To 4	All

P0235-TURBOCHARGER BOOST SENSOR SIGNAL HIGH EXCEEDED — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Turbocharger Boost Pressure/IAT Sensor harness connector. Disconnect the ECM harness connectors. Remove the ASD/Diesel Power Relay from the PDC. Connect a jumper wire between cavity 30 and cavity 87 of the ASD/Diesel Power Relay connector. Turn the ignition on. Measure the voltage between ground and the 5-volt Supply circuit. Is the voltage above 1.0 volt?</p> <p>Yes → Repair the 5-volt Supply circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
4	<p>Turn the ignition off. Disconnect the Turbocharger Boost Pressure/IAT Sensor harness connector. Turn the ignition on. Measure the voltage between ground and the Boost Pressure Sensor Signal circuit. Is the voltage above 1.0 volt?</p> <p>Yes → Go To 5</p> <p>No → Go To 6</p>	All
5	<p>Turn the ignition off. Disconnect the Turbocharger Boost Pressure/IAT Sensor harness connector. Disconnect the ECM harness connectors. Remove the ASD/Diesel Power Relay from the PDC. Connect a jumper wire between cavity 30 and cavity 87 of the ASD/Diesel Power Relay connector. Turn the ignition on. Measure the voltage between ground and the Boost Pressure Sensor Signal circuit. Is the voltage above 1.0 volt?</p> <p>Yes → Repair the Boost Pressure Sensor Signal circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
6	<p>Turn the ignition off. Disconnect the Turbocharger Boost Pressure/IAT Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance of the Sensor Ground circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 7</p> <p>No → Repair the Boost Pressure Sensor Ground circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

P0235-TURBOCHARGER BOOST SENSOR SIGNAL HIGH EXCEEDED — Continued

TEST	ACTION	APPLICABILITY
7	<p>Turn the ignition off. NOTE: Ensure all harness connectors are connected. Turn the ignition on. Measure the voltage of the Boost Pressure Sensor Signal circuit by backprobing ECM harness connector C1, cavity 40. Is the voltage above 4.5 volts?</p> <p>Yes → Replace the Turbocharger Boost Pressure/Intake Air Temperature Sensor. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 8</p>	All
8	<p>Turn the ignition on. With the DRB, read ECM DTCs. Did this DTC reset?</p> <p>Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Ensure good terminal contact between the Turbocharger Boost Pressure/IAT Sensor harness connector and the sensor. The repair is complete. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
9	<p>WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS. NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition. With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Symptom:**P0460-FUEL LEVEL UNIT NO CHANGE OVER MILES****When Monitored and Set Condition:****P0460-FUEL LEVEL UNIT NO CHANGE OVER MILES**

When Monitored: With the ignition on.

Set Condition: The PCM receives a vehicle speed signal for an extended duration without a change in fuel level signal voltage.

POSSIBLE CAUSES

CHECK FOR OTHER DTCS

FUEL TANK OBSTRUCTING THE FUEL LEVEL SENSOR

POWERTRAIN CONTROL MODULE

FUEL LEVEL SENSOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, check for additional PCM DTCs. Are other Fuel Level Sensor DTCs present? Yes → Refer to the Symptom List for diagnosis of other Fuel Level Sensor related DTCs before continuing. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 2	All
2	Turn the ignition off. Disconnect the Fuel Level Sensor harness connector. Turn the ignition on. With the DRB, read and record the Fuel Level Sensor voltage. NOTE: The DRB should read 10.0 volts with the Fuel Level Sensor harness connector disconnected. Connect a 12-volt test light between Fuel Level Sensor harness connector cavities 3 and 4. With the DRB, read the Fuel Level Sensor voltage. Did the voltage change to less than 10.0 volts? Yes → Go To 3 No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All

P0460-FUEL LEVEL UNIT NO CHANGE OVER MILES — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Remove the Fuel Level Sensor from the Fuel Tank in accordance with the Service Information. Inspect the inside of the Fuel Tank for any obstructions or deformities. Is the Fuel Tank OK?</p> <p>Yes → Replace the Fuel Level Sensor in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Repair or replace the Fuel Tank in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:**P0462-FUEL LEVEL SENDING UNIT VOLTS TOO LOW****When Monitored and Set Condition:****P0462-FUEL LEVEL SENDING UNIT VOLTS TOO LOW**

When Monitored: With the ignition on.

Set Condition: The fuel level sensor signal voltage on PCM cavity C3-26 is below 0.25 volt.

POSSIBLE CAUSES

INTERMITTENT CONDITION

FUEL LEVEL SENSOR

FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

FUEL LEVEL SENSOR SIGNAL AND GROUND CIRCUITS SHORTED TOGETHER

POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, erase PCM DTCs. Turn the ignition off, wait 10 seconds, then turn the ignition on. With the DRB, read PCM DTCs. Did this DTC reset? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Disconnect the Fuel Level Sensor harness connector. Turn the ignition on. With the DRB, read the Fuel Level Sensor voltage. Is the voltage above 9.0 volts? Yes → Replace the Fuel Level Sensor in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 3	All
3	Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the Fuel Level Sensor harness connector. Measure the resistance between ground and the Fuel Level Sensor Signal circuit. Is the resistance above 100 kohms? Yes → Go To 4 No → Repair the Fuel Level Sensor Signal circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom List:**P0500-VEH. SPEED SENSOR PEC FREQUENCY TOO HIGH****P0500-VEH. SPEED SENSOR PLAUSIBILITY****P0500-VEH. SPEED SENSOR SRC HIGH EXCEEDED**

Test Note: All symptoms listed above are diagnosed using the same tests.
 The title for the tests will be **P0500-VEH. SPEED SENSOR
 PEC FREQUENCY TOO HIGH.**

When Monitored and Set Condition:**P0500-VEH. SPEED SENSOR PEC FREQUENCY TOO HIGH**

When Monitored: With the engine running.

Set Condition: The ECM detects a vehicle speed greater than 220 km/h (137 MPH).

P0500-VEH. SPEED SENSOR PLAUSIBILITY

When Monitored: With the engine running.

Set Condition: The ECM compares the amount of fuel the fuel quantity actuator is delivering to the vehicle speed from the vehicle speed sensor (VSS). The VSS indicates a vehicle speed that cannot be achieved with the present amount of fuel being delivered.

P0500-VEH. SPEED SENSOR SRC HIGH EXCEEDED

When Monitored: With the engine running.

Set Condition: The ECM detects a vehicle speed greater than 220 km/h (137 MPH).

POSSIBLE CAUSES

Is the resistance below 100 kohms for any of the measurements?</p> <p>Yes → Repair the Control Sleeve Position Sensor circuits that measured below 100 kohms for a short together. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 7</p>	All
7	<p>Turn the ignition off. Disconnect the Fuel Injection Pump harness connector. Disconnect the ECM harness connectors. Measure the resistance between ECM harness connector C2 cavity 56 and Fuel Injection Pump harness connector cavity 1. Measure the resistance between ECM harness connector C2 cavity 57 and Fuel Injection Pump harness connector cavity 2. Measure the resistance between ECM harness connector C2 cavity 58 and Fuel Injection Pump harness connector cavity 3. Is the resistance below 5.0 ohms for each of the measurements?</p> <p>Yes → Go To 8</p> <p>No → Repair the Control Sleeve Position Sensor circuit(s) that measured above 5.0 ohms for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
8	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
9	<p>WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS. NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition. With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present?</p> <p>Yes → Repair as necessary Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Test Complete.</p>	All

Symptom List:**P1225-CONTROL SLEEVE SENSOR START END POS. NOT ATTAINED****P1225-CONTROL SLEEVE SENSOR STOP END POS. NOT ATTAINED**

Test Note: All symptoms listed above are diagnosed using the same tests.
 The title for the tests will be **P1225-CONTROL SLEEVE SENSOR START END POS. NOT ATTAINED.**

When Monitored and Set Condition:**P1225-CONTROL SLEEVE SENSOR START END POS. NOT ATTAINED**

When Monitored: With the ignition on.

Set Condition: The control sleeve sensor signal indicates the control sleeve did not reach its start position.

P1225-CONTROL SLEEVE SENSOR STOP END POS. NOT ATTAINED

When Monitored: With the ignition on.

Set Condition: The control sleeve position sensor signal indicates the control sleeve is not at its ending position.

POSSIBLE CAUSES

ENGINE CONTROL MODULE

REPLACE THE FUEL INJECTION PUMP

INTERMITTENT CONDITION

TEST	ACTION	APPLICABILITY
1	<p>NOTE: If other Control Sleeve Position Sensor or Fuel Quantity Actuator DTCs are present, diagnose the other DTCs before continuing.</p> <p>Turn the ignition on. With the DRB, erase ECM DTCs. Perform several drive cycles, turning the ignition off for at least 10 seconds between each drive cycle. Monitor the DRB for ECM DTCs. Did this DTC reset?</p> <p>Yes → Go To 2 No → Go To 3</p>	All

P1225-CONTROL SLEEVE SENSOR START END POS. NOT ATTAINED — Continued

TEST	ACTION	APPLICABILITY
2	<p>Replace the Fuel Injection Pump in accordance with the Service Information. With the DRB, erase ECM DTCs. Perform several drive cycles, turning the ignition off for at least 10 seconds between each drive cycle. Monitor the DRB for ECM DTCs. Did this DTC reset?</p> <p>Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → The repair is complete. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
3	<p>WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS. NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition. With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Symptom List:

P1515-ACCEL. PEDAL SENSOR PLAUSIBILITY

P1515-ACCEL. PEDAL SENSOR PWG PLAUS WITH POTENTIOMETER

P1515-ACCEL. PEDAL SENSOR SIGNAL HIGH EXCEEDED

P1515-ACCEL. PEDAL SENSOR SUPPLY HIGH EXCEEDED

P1515-ACCEL. PEDAL SENSOR SUPPLY LOW EXCEEDED

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P1515-ACCEL. PEDAL SENSOR PLAUSIBILITY.

When Monitored and Set Condition:

P1515-ACCEL. PEDAL SENSOR PLAUSIBILITY

When Monitored: With the ignition on.

Set Condition: The accelerator pedal position sensor signal is below 0.2 volt (4%) or above 4.5 volts (90%) and the idle switch is not in the correct state. NOTE: The idle switch is designed to transition when the accel position is approximately 16% (1.00 volt). This code sets the ECM to Limp-in Mode, which includes a fixed engine speed of 1100 RPM.

P1515-ACCEL. PEDAL SENSOR PWG PLAUS WITH POTENTIOMETER

When Monitored: With the ignition on.

Set Condition: The accelerator pedal position sensor signal is below 0.20 volts, the idle switch transitions at too high a percentage intermittently or the idle switch is not in the correct state intermittently. NOTE: The idle switch is designed to transition when the accel position is approximately 16% (1.00 volt). This code sets the ECM to Limp-in Mode, which includes a fixed engine speed of 1100 RPM.

P1515-ACCEL. PEDAL SENSOR SIGNAL HIGH EXCEEDED

When Monitored: With the ignition on.

Set Condition: The accelerator pedal position sensor signal voltage is above 4.5 volts. NOTE: This code sets the ECM to Limp-in Mode, which includes a fixed engine speed of 1100 RPM.

P1515-ACCEL. PEDAL SENSOR SUPPLY HIGH EXCEEDED

When Monitored: With the ignition on.

Set Condition: The ECM detects voltage on the accelerator pedal position sensor 5-volt supply circuit above 5.2 volts.

P1515-ACCEL. PEDAL SENSOR SUPPLY LOW EXCEEDED

When Monitored: With the ignition on.

Set Condition: The ECM detects voltage the accelerator pedal position sensor 5-volt supply circuit below 4.75 volts.

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, erase ECM DTCs. Start and stop the engine several times, pausing for 10 seconds at key off each time. Turn the ignition on. With the DRB, read ECM DTCs. Did this DTC reset? Yes → Go To 2 No → Go To 5	All
2	Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the Fuel Injection Pump harness connector. Remove the ASD/Diesel Power Relay from the PDC. Connect a jumper wire between cavity 30 and cavity 87 of the ASD/Diesel Power Relay connector. Turn the ignition on. Measure the voltage on the Fuel Shutdown Solenoid Control circuit. Is the voltage below 0.5 volt? Yes → Go To 3 No → Repair the Fuel Shutdown Solenoid Control circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2. NOTE: Remove the jumper wire from the ASD/Diesel Power Relay connector, reinstall the ASD/Diesel Power Relay in the PDC, and reconnect the ECM harness connectors.	All

P1660-REDUNDANT EMERG. STOP PLAUSIBILITY IN AFTER-RUN — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Fuel Injection Pump harness connector. Turn the ignition on. With the DRB, actuate the Fuel Shutdown Solenoid. Measure the voltage on the Fuel Shutdown Solenoid Control circuit. Does the voltage cycle from B+ to below 1.0 volt?</p> <p>Yes → Replace the Fuel Injection Pump in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 4</p>	All
4	<p>Disconnect the Fuel Injection Pump harness connector. Measure the resistance between the following cavities in the Fuel Injection Pump connector (fuel pump side): Cavity 1 to cavities 4, 5, 6, 7, 8, 9, and 10. Cavity 4 to cavities 5, 6, 7, 8, 9, and 10. Cavity 5 to cavities 6, 7, 8, and 9. Cavity 7 to cavities 6, 8, 9, and 10. Cavity 8 to cavities 6 and 10. NOTE: The resistance should be above 100 ohms for all measurements. Is the resistance above 100 ohms for each of the measurements?</p> <p>Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Replace the Fuel Injection Pump in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
5	<p>WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS. NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition. With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present?</p> <p>Yes → Repair as necessary Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Test Complete.</p>	All

Symptom:

P1660-REDUNDANT EMERG. STOP POWERSTAGE DEFECTIVE

When Monitored and Set Condition:

P1660-REDUNDANT EMERG. STOP POWERSTAGE DEFECTIVE

When Monitored: With the ignition on.

Set Condition: The ECM detects an open or short to ground on the fuel shutdown solenoid control circuit.

POSSIBLE CAUSES

INTERMITTENT CONDITION

FUEL SHUTDOWN SOLENOID CONTROL CIRCUIT OPEN

FUEL SHUTDOWN SOLENOID CONTROL CIRCUIT SHORTED TO GROUND

FUEL SHUTDOWN SOLENOID (FUEL INJECTION PUMP) SHORTED INTERNALLY

INTERNAL FUEL INJECTION PUMP TEST

ENGINE CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, erase ECM DTCs. Cycle the ignition on and off several times, pausing for 10 seconds at key off each time. Turn the ignition on. With the DRB, read ECM DTCs. Did this DTC reset? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the Fuel Injection Pump harness connector. Measure the resistance of the Fuel Shutdown Solenoid Control circuit. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the Fuel Shutdown Solenoid Control circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All

P1660-REDUNDANT EMERG. STOP POWERSTAGE DEFECTIVE — **Continued**

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the Fuel Injection Pump harness connector. Measure the resistance between ground and the Fuel Shutdown Solenoid Control circuit. Is the resistance above 100 kohms? Yes → Go To 4 No → Repair the Fuel Shutdown Solenoid Control circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.	All
4	Turn the ignition off. Disconnect the Fuel Injection Pump harness connector. Turn the ignition on. With the DRB, actuate the Fuel Shutdown Solenoid. Measure the voltage on the Fuel Shutdown Solenoid Control circuit. Does the voltage cycle from B+ to below 1.0 volt? Yes → Replace the Fuel Injection Pump in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 5	All
5	Disconnect the Fuel Injection Pump harness connector. Measure the resistance between the following cavities in the Fuel Injection Pump connector (fuel pump side): Cavity 1 to cavities 4, 5, 6, 7, 8, 9, and 10. Cavity 4 to cavities 5, 6, 7, 8, 9, and 10. Cavity 5 to cavities 6, 7, 8, and 9. Cavity 7 to cavities 6, 8, 9, and 10. Cavity 8 to cavities 6 and 10. NOTE: The resistance should be above 100 ohms for all measurements. Is the resistance above 100 ohms for each of the measurements? Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Replace the Fuel Injection Pump in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom List:

P1685-VEHICLE THEFT ALARM IMMOBILIZER SIG LOST
P1685-VEHICLE THEFT ALARM INVALID SKIM MESSAGE

Test Note: All symptoms listed above are diagnosed using the same tests.
 The title for the tests will be **P1685-VEHICLE THEFT ALARM IMMOBILIZER SIG LOST**.

When Monitored and Set Condition:**P1685-VEHICLE THEFT ALARM IMMOBILIZER SIG LOST**

When Monitored: With the ignition on and the immobilizer disarmed.

Set Condition: The ECM detects an open, short to ground, or short to voltage on the immobilizer signal circuit.

P1685-VEHICLE THEFT ALARM INVALID SKIM MESSAGE

When Monitored: With the ignition on.

Set Condition: The ECM determines that the coded message from the PCM does not match the message programmed into memory.

POSSIBLE CAUSES

CHECK FOR SKIM COMMUNICATION AND DTCS
 ECM - VIN MISMATCH
 PCM - VIN MISMATCH
 IMMOBILIZER SIGNAL CIRCUIT SHORTED TO VOLTAGE
 IMMOBILIZER SIGNAL CIRCUIT SHORTED TO GROUND
 ENGINE CONTROL MODULE
 IMMOBILIZER SIGNAL CIRCUIT OPEN
 ENGINE CONTROL MODULE - INTERNAL SHORT
 POWERTRAIN CONTROL MODULE - INTERNAL SHORT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, check for Sentry Key Immobilizer Module communication and DTCS. Are any SKIS problems or DTCS present? Yes → Refer to symptom list for problems related to SKIM Communication and DTCS before continuing. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 2	All

P1685-VEHICLE THEFT ALARM IMMOBILIZER SIG LOST — Continued

TEST	ACTION	APPLICABILITY
2	<p>With the DRB, select ENGINE, then BOSCH 3.1L VM DIESEL CONTROLLER from the menu. Display the Vehicle Identification Number (VIN). Compare the programmed VIN to the vehicle VIN. Does the programmed VIN match the vehicle VIN?</p> <p>Yes → Go To 3</p> <p>No → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
3	<p>With the DRB, select ENGINE, then JTEC CONTROLLER from the menu. Display the Vehicle Identification Number (VIN). Compare the programmed VIN to the vehicle VIN. Does the programmed VIN match the vehicle VIN?</p> <p>Yes → Go To 4</p> <p>No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
4	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the PCM harness connectors. Remove the ASD/Diesel Power Relay from the PDC. Connect a jumper wire between cavity 30 and cavity 87 of the ASD/Diesel Power Relay connector. Turn the ignition on. Measure the voltage of the Immobilizer Signal circuit. Is the voltage below 1.0 volt?</p> <p>Yes → Go To 5</p> <p>No → Repair the Immobilizer Signal circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>NOTE: Remove the jumper wire and install the ASD/Diesel Power Relay.</p>	All
5	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the PCM harness connectors. Measure the resistance between ground and the Immobilizer Signal circuit. Is the resistance above 100 kohms?</p> <p>Yes → Go To 6</p> <p>No → Repair the Immobilizer Signal circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
6	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the PCM harness connectors. Measure the resistance of the Immobilizer Signal circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 7</p> <p>No → Repair the Immobilizer Signal circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

P1685-VEHICLE THEFT ALARM IMMOBILIZER SIG LOST — Continued

TEST	ACTION	APPLICABILITY
7	<p>Turn the ignition off.</p> <p>NOTE: Ensure the ECM harness connectors are connected.</p> <p>Measure the amperage between ground and the Immobilizer Signal circuit in PCM harness connector C3.</p> <p>Turn the ignition on.</p> <p>Is the amperage between 1.0 and 1.4 milliamps?</p> <p>Yes → Go To 8</p> <p>No → Replace and program the Engine Control Module in accordance with the Service Information.</p> <p>Perform ROAD TEST VERIFICATION - VER-2.</p>	All
8	<p>Turn the ignition off.</p> <p>NOTE: Ensure all connectors are connected.</p> <p>With the DRB oscilloscope function, select LAB SCOPE and set the oscilloscope to the following specifications:</p> <p>Voltage Range to +20.0V</p> <p>Probe to X10</p> <p>Time Range to 0.1s/Div</p> <p>Turn the ignition on.</p> <p>With the DRB oscilloscope lead, back probe PCM harness connector C3 cavity 16.</p> <p>NOTE: A valid Immobilizer Signal voltage will cycle high and low.</p> <p>Does the DRB display show the 12-volt Immobilizer Signal voltage cycling high and low?</p> <p>Yes → Replace and program the Engine Control Module in accordance with the Service Information.</p> <p>Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Replace and program the Powertrain Control Module in accordance with the Service Information.</p> <p>Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:

P1690-FAN CONTROL OPEN CIRCUIT

When Monitored and Set Condition:

P1690-FAN CONTROL OPEN CIRCUIT

When Monitored: With the ignition on.

Set Condition: The ECM detects an open or short to ground on the radiator fan relay control circuit.

POSSIBLE CAUSES

INTERMITTENT CONDITION

ASD/DIESEL POWER RELAY OUTPUT CIRCUIT OPEN

SUBSTITUTE RADIATOR FAN RELAY

RADIATOR FAN RELAY CONTROL CIRCUIT SHORTED TO GROUND

RADIATOR FAN RELAY CONTROL CIRCUIT OPEN

ENGINE CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, actuate the Radiator Fan Relay. Does the Radiator Fan cycle on and off? Yes → Go To 2 No → Go To 3	All
2	WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS. NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition. With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present? Yes → Repair as necessary Perform ROAD TEST VERIFICATION - VER-2. No → Test Complete.	All

P1690-FAN CONTROL OPEN CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Remove the Radiator Fan Relay from the PDC. Turn the ignition on. Using a 12-volt test light connected to ground, check the ASD/Diesel Power Relay Output circuit. Did the test light illuminate brightly? Yes → Go To 4 No → Repair the ASD/Diesel Power Relay Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
4	Turn the ignition off. Install a substitute relay in place of the Radiator Fan Relay. Turn the ignition on. With the DRB, actuate the Radiator Fan Relay. Does the Radiator Fan cycle on and off? Yes → Replace the Radiator Fan Relay. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 5	All
5	Turn the ignition off. Remove the Radiator Fan Relay from the PDC. Disconnect the ECM harness connectors. Measure the resistance between ground and the Radiator Fan Relay Control circuit. Is the resistance below 100 kohms? Yes → Repair the Radiator Fan Relay Control circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 6	All
6	Turn the ignition off. Remove the Radiator Fan Relay from the PDC. Disconnect the ECM harness connectors. Measure the resistance of the Radiator Fan Relay Control circuit. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the Radiator Fan Relay Control circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
7	If there are no possible causes remaining, view repair. Repair Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:

P1690-FAN CONTROL SHORT CIRCUIT

When Monitored and Set Condition:

P1690-FAN CONTROL SHORT CIRCUIT

When Monitored: With the ignition on and the ECM attempting to enable the radiator fan relay.

Set Condition: The ECM detects excessive current draw on the radiator fan relay control circuit.

POSSIBLE CAUSES

INTERMITTENT CONDITION

SUBSTITUTE RADIATOR FAN RELAY

RADIATOR FAN RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE

ENGINE CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, actuate the Radiator Fan Relay. Does the Radiator Fan cycle on and off? Yes → Go To 2 No → Go To 3	All

Symptom:

P1703-BRAKE SIGNAL PLAUS WITH REDUNDANT CONTACT

When Monitored and Set Condition:

P1703-BRAKE SIGNAL PLAUS WITH REDUNDANT CONTACT

When Monitored: With the ignition on.

Set Condition: The ECM detects the brake switch sense circuit and brake lamp switch output circuit inputs to the ECM do not agree. NOTE: An out of adjustment brake lamp switch may also cause a reduction in engine power.

POSSIBLE CAUSES

INTERMITTENT CONDITION

BRAKE LAMP SWITCH (SECONDARY OPEN)

BRAKE LAMP SWITCH FUSED B+ CIRCUIT OPEN

SECONDARY BRAKE SWITCH SIGNAL CIRCUIT SHORTED TO GROUND

BRAKE LAMP SWITCH (PRIMARY OPEN)

SECONDARY BRAKE SWITCH GROUND CIRCUIT OPEN

SECONDARY BRAKE SWITCH SIGNAL CIRCUIT OPEN

PRIMARY BRAKE SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE

PRIMARY BRAKE SWITCH SIGNAL CIRCUIT OPEN

ENGINE CONTROL MODULE (INTERNAL)

ENGINE CONTROL MODULE (PRIMARY BRAKE SIGNAL)

ENGINE CONTROL MODULE (SECONDARY BRAKE SIGNAL)

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. While observing the PRIM BRAKE SWITCH status on the DRB display, press and release the brake pedal several times. Does the DRB display PRIM BRAKE SWITCH: PRESSED and RELEASED for the appropriate pedal position? Yes → Go To 2 No → Go To 11	All
2	Turn the ignition on. While observing the SEC BRAKE SWITCH status on the DRB display, press and release the brake pedal several times. Does the DRB display SEC BRAKE SWITCH: PRESSED and RELEASED for the appropriate pedal position? Yes → Go To 3 No → Go To 4	All

Symptom List:

P1725-INDUCTIVE AUX. SPEED SENSOR DYN. PLAUSIBILITY

P1725-INDUCTIVE AUX. SPEED SENSOR OVERSPEED RECOGNITION

P1725-INDUCTIVE AUX. SPEED SENSOR PLAUSIBILITY

P1725-INDUCTIVE AUX. SPEED SENSOR STATIC PLAUSIBILITY

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P1725-INDUCTIVE AUX. SPEED SENSOR DYN. PLAUSIBILITY.

When Monitored and Set Condition:

P1725-INDUCTIVE AUX. SPEED SENSOR DYN. PLAUSIBILITY

When Monitored: With the engine running.

Set Condition: The ECM has determined that the inductive auxiliary speed sensor values are incorrect during an engine speed transition.

P1725-INDUCTIVE AUX. SPEED SENSOR OVERSPEED RECOGNITION

When Monitored: With the engine running.

Set Condition: The ECM detects the engine speed signal from the needle movement sensor has exceeded 6600 RPM.

P1725-INDUCTIVE AUX. SPEED SENSOR PLAUSIBILITY

When Monitored: With the engine running.

Set Condition: The ECM has determined that the needle movement sensor input is incorrect.

P1725-INDUCTIVE AUX. SPEED SENSOR STATIC PLAUSIBILITY

When Monitored: With the engine running.

Set Condition: The ECM has determined that the inductive auxiliary speed sensor values are incorrect.

POSSIBLE CAUSES

INTERMITTENT CONDITION

CHECK THE NEEDLE MOVEMENT SENSOR CONNECTOR TERMINALS

MIS-ROUTED WIRING HARNESS

NEEDLE MOVEMENT SENSOR SIGNAL CIRCUIT OPEN

NEEDLE MOVEMENT SENSOR GROUND CIRCUIT OPEN

ENGINE CONTROL MODULE

P1725-INDUCTIVE AUX. SPEED SENSOR DYN. PLAUSIBILITY — Continued

POSSIBLE CAUSES

NEEDLE MOVEMENT SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

NEEDLE MOVEMENT SENSOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, erase ECM DTCs. Start the engine and vary the engine speed from idle to 3500 RPM several times. With the DRB, read ECM DTCs. Did this DTC reset? Yes → Go To 2 No → Go To 8	All
2	Turn the ignition off. Disconnect the Needle Movement Sensor harness connector. Check the Needle Movement Sensor connector terminals in the harness side connector and the sensor side connector. Is there any damage or corrosion to any of the terminals in either connector? Yes → Repair as necessary. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 3	All
3	NOTE: EMI interference can be caused by high current carrying wires or the Alternator. Check the wiring harness for mis-routing that could cause EMI interference. Is the wiring harness mis-routed? Yes → Repair as necessary. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 4	All
4	Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the Needle Movement Sensor harness connector. Measure the resistance of the Needle Movement Sensor Signal circuit. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the Needle Movement Sensor Signal circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
5	Turn the ignition off. Disconnect the Needle Movement Sensor harness connector. Disconnect the ECM harness connectors. Measure the resistance of the Needle Movement Sensor Ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the Needle Movement Sensor Ground circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All

P1725-INDUCTIVE AUX. SPEED SENSOR DYN. PLAUSIBILITY — Continued

TEST	ACTION	APPLICABILITY
6	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the Needle Movement Sensor harness connector. Measure the resistance between ground and the Needle Movement Sensor Signal circuit. Is the resistance above 100 kohms?</p> <p>Yes → Go To 7</p> <p>No → Repair the Needle Movement Sensor Signal circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
7	<p>Turn the ignition off. Replace the Needle Movement Sensor in accordance with the Service Information. Turn the ignition on. With the DRB, erase ECM DTCs. Start the engine and vary the engine speed from idle to 3500 RPM several times. With the DRB, read ECM DTCs. Did this DTC reset?</p> <p>Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → The repair is complete. PCM - A/C SELECT SWITCH SENSE CIRCUIT OPEN
PCM - A/C SWITCH INPUT
PCM - INTERNAL A/C SELECT SWITCH CIRCUIT

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Prior to diagnosing the A/C electrical system, check for proper A/C system pressure. Improper refrigerant charge can cause incorrect system diagnosis and unnecessary component replacement.</p> <p>NOTE: Refer to the Service Information to check the A/C mechanical system before continuing.</p> <p>With the DRB, select Engine, JTEC then Inputs/Outputs. Start the engine and set the blower to Panel. Turn the A/C on. With the DRB, read the A/C Select Switch. Does the DRB display A/C Select Switch YES?</p> <p>Yes → Go To 2</p> <p>No → Go To 16</p>	All

*CHECKING THE A/C SYSTEM — Continued

TEST	ACTION	APPLICABILITY
2	<p>With the DRB, select Engine, Bosch Controller then Inputs/Outputs. Start the engine and set the blower to Panel. Turn the A/C on. With the DRB, read the A/C Switch. Does the DRB display A/C Switch ON?</p> <p>Yes → Go To 3</p> <p>No → Go To 13</p>	All
3	<p>Turn the ignition on. With the DRB, select Engine, Bosch Controller then Inputs/Outputs. Read the A/C H/L Press Sw Does the DRB display A/C H/L Press Sw ON?</p> <p>Yes → Go To 4</p> <p>No → Go To 8</p>	All
4	<p>Turn the ignition on. With the DRBIII®, actuate the A/C Compressor Clutch Relay. Observe the A/C Compressor Clutch during actuation. Is the A/C Compressor Clutch clicking?</p> <p>Yes → The electrical portion of the A/C System is operating properly. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 5</p>	All
5	<p>Remove the A/C Compressor Clutch Relay from the PDC. Using a 12-volt test light connected to ground, check the Fused B+ circuit. Is the test light on?</p> <p>Yes → Go To 6</p> <p>No → Repair the Fused B+ circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
6	<p>Remove the A/C Compressor Clutch Relay from the PDC. Disconnect the A/C Compressor Clutch harness connector. Connect a jumper wire across the A/C Compressor Clutch Relay connector cavities 30 and 87 in the PDC. Using a 12-volt test light connected to ground, check the A/C Compressor Clutch Relay Output circuit in the A/C Compressor Clutch harness connector. Is the test light on?</p> <p>Yes → Go To 7</p> <p>No → Repair the A/C Compressor Clutch Relay Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
7	<p>Disconnect the A/C Compressor Clutch harness connector. Using a 12-volt test light connected to 12 volts, check the A/C Compressor Clutch Ground circuit. Is the test light on?</p> <p>Yes → Replace the A/C Compressor Clutch in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Repair the A/C Compressor Clutch Ground circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

***CHECKING THE A/C SYSTEM — Continued**

TEST	ACTION	APPLICABILITY
8	<p>Turn the ignition on. Connect one end of a jumper wire to ground and back probe the A/C Pressure Signal circuit at the ECM harness connector. With the DRB, select Engine, Bosch Controller then Inputs/Outputs. Read the A/C H/L Press Sw. Does the DRB display A/C H/L Press Sw ON?</p> <p>Yes → Go To 9</p> <p>No → Replace and program the ECM in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
9	<p>Disconnect the A/C High Pressure Switch harness connector. Turn the ignition on. Connect one end of a jumper wire to ground and back probe the A/C Pressure Signal circuit at the A/C High Pressure Switch harness connector. With the DRB, select Engine, Bosch Controller then Inputs/Outputs. Read the A/C H/L Press Sw. Does the DRB display A/C H/L Press Sw ON?</p> <p>Yes → Go To 10</p> <p>No → Repair the A/C Pressure Signal circuit for an open between the ECM and the A/C High Pressure Switch. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
10	<p>Turn the ignition off. Disconnect the A/C High Pressure Switch harness connector. Measure the resistance of the A/C High Pressure Switch. Is the Resistance below 10.0 ohms?</p> <p>Yes → Go To 11</p> <p>No → Replace the A/C High Pressure Switch. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
11	<p>Disconnect the A/C Low Pressure Switch harness connector. Turn the ignition on. Connect one end of a jumper wire to ground and the other end to the A/C Pressure Sense circuit at the A/C Low Pressure Switch harness connector. With the DRB, select Engine, Bosch Controller then Inputs/Outputs. Read the A/C H/L Press Sw. Does the DRB display A/C H/L Press Sw ON?</p> <p>Yes → Go To 12</p> <p>No → Repair the A/C Pressure Sense circuit for an open between the A/C High Pressure Switch and the A/C Low Pressure Switch. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
12	<p>Turn the ignition off. Disconnect the A/C Low Pressure Switch harness connector. Measure the resistance of the A/C Low Pressure Switch. Is the Resistance below 10.0 ohms?</p> <p>Yes → Repair the ground circuit at the A/C Low Pressure Switch for an open. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Replace the A/C Low Pressure Switch. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

*CHECKING THE A/C SYSTEM — Continued

TEST	ACTION	APPLICABILITY
13	<p>Turn the ignition off. Disconnect the PCM harness connectors. Turn the ignition on. With the DRB, select Engine, Bosch Controller then Inputs/Outputs. While reading the A/C Switch input, use a jumper wire to connect the A/C Switch Signal circuit to ground at the PCM harness connector. Does the DRB display A/C Switch ON?</p> <p>Yes → Replace and program the PCM in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 14</p>	All
14	<p>Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the ECM harness connectors. Measure the resistance between ground and the A/C Switch Signal circuit. Is the resistance below 100.0 ohms?</p> <p>Yes → Repair the A/C Switch Signal circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 15</p>	All
15	<p>Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the ECM harness connectors. Measure the resistance of the A/C Switch Signal circuit. Is the resistance below 10.0 ohms?</p> <p>Yes → Replace and program the ECM in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Repair the A/C Switch Signal circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
16	<p>Turn the ignition off. Disconnect the A/C Heater Control harness connectors. Disconnect the PCM harness connectors. Turn the ignition on. Measure the voltage of the A/C Select Switch Sense circuit. Is the voltage below 1.0 volt?</p> <p>Yes → Go To 17</p> <p>No → Repair the A/C Select Switch Sense circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
17	<p>Turn the ignition off. Disconnect the A/C Heater Control harness connectors. Disconnect the PCM harness connectors. Measure the resistance between ground and the A/C Select Switch Sense circuit. Is the resistance below 100.0 ohms?</p> <p>Yes → Repair the A/C Select Switch Sense circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 18</p>	All

***CHECKING THE A/C SYSTEM — Continued**

TEST	ACTION	APPLICABILITY
18	Turn the ignition off. Disconnect the A/C Heater Control harness connectors. Disconnect the PCM harness connectors. Measure the resistance of the A/C Select Switch Sense circuit. Is the resistance below 10.0 ohms? Yes → Go To 19 No → Repair the A/C Select Switch Sense circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
19	Turn the ignition off. Disconnect the A/C Heater Control harness connectors. Turn the ignition on. With the DRB, select Engine, JTEC then Inputs/Outputs Start the Engine. Connect a jumper wire between the A/C Select Switch Sense circuit and ground at the A/C Heater Control harness connector. With the DRB, read the A/C Select Switch. Does the DRB display A/C Select Switch YES? Yes → Refer to symptom list for problems related to A/C Select Switch operation. Perform ROAD TEST VERIFICATION - VER-2. No → Replace and program the PCM in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:

*CHECKING THE ACCELERATOR PEDAL POSITION SENSOR CALIBRATION

POSSIBLE CAUSES

APP SENSOR

APP SENSOR - IDLE

APP SENSOR - WOT

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure the Accelerator pedal is free from any restriction or binding before continuing. Turn the ignition on. While back probing, measure the voltage of the APP Sensor Signal circuit at the ECM. NOTE: The accelerator pedal must be released for this step. Is the voltage below 1.0 volt?</p> <p>Yes → Go To 2</p> <p>No → Replace the Accelerator Pedal Position Sensor in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
2	<p>Turn the ignition on. While back probing, measure the voltage of the APP Sensor Signal circuit at the ECM. Monitor the voltmeter while slowly pressing the accelerator pedal completely down. Did the voltage increase smoothly with pedal travel?</p> <p>Yes → Go To 3</p> <p>No → Replace the Accelerator Pedal Position Sensor in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
3	<p>Turn the ignition on. While back probing, measure the voltage of the APP Sensor Signal circuit at the ECM. Press the accelerator pedal completely down. Is the voltage above 3.5 volts?</p> <p>Yes → Test Complete.</p> <p>No → Replace the Accelerator Pedal Position Sensor in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:***CHECKING THE CHECK ENGINE LAMP OPERATION**

POSSIBLE CAUSES
ACTUATE CHECK ENGINE LAMP
CHECK ENGINE CONTROL CIRCUIT SHORTED TO VOLTAGE
CHECK ENGINE LAMP BULB
ENGINE CONTROL MODULE
INSTRUMENT CLUSTER
INSTRUMENT CLUSTER - LAMP NEVER ON
POWERTRAIN CONTROL MODULE - CONTROL SHORTED TO VOLTAGE
POWERTRAIN CONTROL MODULE - INTERNAL FAULT
CHECK ENGINE LAMP CONTROL CIRCUIT SHORTED TO GROUND
CHECK ENGINE LAMP CONTROL CIRCUIT OPEN
POWERTRAIN CONTROL MODULE - CONTROL SHORTED TO GROUND

TEST	ACTION	APPLICABILITY
1	Turn the ignition on and observe the Check Engine Lamp. Did the Check Engine Lamp illuminate for approximately 2 seconds then go out for a bulb check? Yes → Go To 2 No → Go To 10	All
2	Turn the ignition on. With the DRB, actuate the Diag/Glow Plug Lamp. Did the Check Engine Lamp illuminate? Yes → The Check Engine Lamp System is working properly. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 3	All
3	Turn the ignition off. Disconnect the ECM harness connectors. Turn the ignition on. Measure the voltage of the Check Engine Lamp Control circuit. Is the voltage between 4.8 and 5.5 volts? Yes → Go To 4 Above Go To 6 Below Go To 7	All

*CHECKING THE CHECK ENGINE LAMP OPERATION — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the ECM harness connectors. Remove the ASD/Diesel Power Relay from the PDC. Connect a jumper wire between cavity 30 and cavity 87 of the ASD/Diesel Power Relay connector. Turn the ignition on. Connect a jumper wire between the Check Engine Lamp Control circuit and ground. Did the Check Engine Lamp illuminate?</p> <p>Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the ECM harness connectors. Remove the ASD/Diesel Power Relay from the PDC. Connect a jumper wire between cavity 30 and cavity 87 of the ASD/Diesel Power Relay connector. Turn the ignition on. Connect a jumper wire between the Check Engine Lamp Control circuit and ground. With the DRB, select Body from the System menu, then Monitor CCD Bus Info. Does the DRB display Engine Lamp Status On?</p> <p>Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
6	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the PCM harness connectors. Remove the ASD/Diesel Power Relay from the PDC. Connect a jumper wire between ASD/Diesel Power Relay connector cavities 30 and 87 (in PDC). Turn the ignition on. Measure the voltage of the Check Engine Lamp Control circuit. Is the voltage below 0.5 volt?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Repair the Check Engine Lamp Control circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

***CHECKING THE CHECK ENGINE LAMP OPERATION — Continued**

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the ECM harness connectors. Measure the resistance between ground and the Check Engine Lamp Control circuit. Is the resistance above 100 kohms? Yes → Go To 8 No → Repair the Check Engine Lamp Control circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.	All
8	Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the PCM harness connectors. Measure the resistance of the Check Engine Lamp Control circuit. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair the Check Engine Lamp Control circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
9	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All
10	Turn the ignition off. Remove and inspect the Check Engine Lamp bulb from the Instrument Cluster. Is the bulb OK? Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Replace the Check Engine Lamp bulb. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:

*CHECKING THE ECM AND PCM POWER AND GROUND CIRCUITS

POSSIBLE CAUSES

ASD RELAY OUTPUT CIRCUIT OPEN AT ECM
 ASD RELAY OUTPUT OPEN AT PCM
 ECM GROUND CIRCUIT OPEN
 FUSED ASD BATTERY SUPPLY CIRCUIT OPEN
 FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
 PCM BATTERY SUPPLY CIRCUIT OPEN
 PCM GROUND CIRCUIT OPEN

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition off. Disconnect the ECM harness connectors. Using a 12-volt test light connected to 12-volts, check both of the ECM ground circuits in ECM harness connector C1 cavities 1 and 27. Did the test light illuminate for both cavities?</p> <p>Yes → Go To 2</p> <p>No → Repair the ECM Ground circuit(s) for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
2	<p>Turn the ignition off. Disconnect the ECM harness connectors. Turn the ignition on. Using a 12-volt test light connected to ground, check the Fused Ignition Switch Output circuit in ECM harness connector C1 cavity 47. Is the test light on?</p> <p>Yes → Go To 3</p> <p>No → Repair the Fused Ignition Switch Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
3	<p>Turn the ignition off. Remove the ASD/Diesel Power Relay from the PDC. Using a 12-volt test light connected to ground, check the Fused ASD Battery Supply circuit in ASD/Diesel Power Relay connector cavity 30. Is the test light on?</p> <p>Yes → Go To 4</p> <p>No → Repair the Fused ASD Battery Supply circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

***CHECKING THE ECM AND PCM POWER AND GROUND CIRCUITS —**
Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the ECM harness connectors. Remove the ASD/Diesel Power Relay from the PDC. Connect a jumper wire between cavity 30 and cavity 87 in the ASD/Diesel Power Relay connector. Using a 12-volt test light connected to ground, check the ASD Relay Output circuit in ECM harness connector C1 cavities 2 and 28. Did the test light illuminate for both circuits?</p> <p>Yes → Go To 5</p> <p>No → Repair the ASD Relay Output circuit(s) for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
5	<p>Disconnect the PCM harness connectors. Using a 12-volt test light connected to ground, check the PCM Battery Supply circuit in PCM harness connector C1 cavity 22. Is the test light on?</p> <p>Yes → Go To 6</p> <p>No → Repair the PCM Battery Supply circuit(s) for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
6	<p>Disconnect the PCM harness connectors. Using a 12-volt test light connected to 12-volts, check both PCM Ground circuits in PCM harness connector C1 cavities 31 and 32. Did the test light illuminate for both cavities?</p> <p>Yes → Go To 7</p> <p>No → Repair the PCM Ground circuit(s) for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
7	<p>Turn the ignition off. Remove the ASD/Diesel Power Relay from the PDC. Disconnect the PCM harness connectors. Connect a jumper wire between cavity 30 and cavity 87 of the ASD/Diesel Power Relay connector. Using a 12-volt test light connected to ground, check the ASD Relay Output circuit in PCM harness connectors C1 cavity 2 and C3 cavity 12. Did the test light illuminate for both circuits?</p> <p>Yes → Test Complete.</p> <p>No → Repair the ASD Relay Output circuit(s) for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:

*CHECKING THE EGR SYSTEM

POSSIBLE CAUSES
ASD RELAY OUTPUT CIRCUIT OPEN
EGR VALVE
GROUND CIRCUIT OPEN
VACUUM SUPPLY HOSE

TEST	ACTION	APPLICABILITY
1	<p>Disconnect the Vacuum Supply Hose at the EGR solenoid. Connect a vacuum gauge to the Vacuum Supply Hose. Start the engine and allow the engine to idle. Is the vacuum above 10 inches of mercury at idle?</p> <p>Yes → Go To 2</p> <p>No → Repair leaking or restricted Vacuum Supply Hose or faulty Vacuum Supply Pump. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
2	<p>Turn the ignition off. Disconnect the EGR Solenoid harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, check the ASD Relay Output circuit at the EGR Solenoid harness connector. Is the test light on?</p> <p>Yes → Go To 3</p> <p>No → Repair the ASD Relay Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
3	<p>Turn the ignition off. Disconnect the EGR Solenoid harness connector. Using a 12-volt test light connected to 12-volts, check the Ground circuit in the EGR Solenoid harness connector. Is the test light on?</p> <p>Yes → Go To 4</p> <p>No → Repair the Ground circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
4	<p>NOTE: The Vacuum Output Hose must not be leaking or restricted for the result of this test to be valid.</p> <p>Turn the ignition off. Disconnect the Vacuum Supply and Vacuum Output Hoses in the EGR Solenoid vacuum connector. Connect the Vacuum Supply Hose to the Vacuum Output Hose. Test drive the vehicle and observe vehicle performance. Is there a power reduction on vehicle acceleration?</p> <p>Yes → Test Complete.</p> <p>No → Replace the EGR Valve. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:***CHECKING THE ELECTRIC RADIATOR FAN OPERATION**

POSSIBLE CAUSES	
ACTUATE THE RADIATOR FAN RELAY WITH THE DRB	
CHECK FOR FAN CONTROL DTCS	
RADIATOR FAN RELAY - SHORTED	
RADIATOR FAN RELAY OUTPUT CIRCUIT SHORTED TO VOLTAGE	
FUSED B+ CIRCUIT OPEN	
SUBSTITUTE RADIATOR FAN RELAY	
RADIATOR FAN RELAY OUTPUT CIRCUIT OPEN	
RADIATOR FAN GROUND CIRCUIT OPEN	
RADIATOR FAN - OPEN	

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. With the DRB, check for ECM Fan Control DTCS. Are any Fan Control DTCS present?</p> <p>Yes → Refer to symptom list for problems related to the Fan Control DTCS. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition on. With the DRB, actuate the Radiator Fan Relay and observe the Radiator Fan. Did the Radiator Fan cycle on and off?</p> <p>Yes → The test is complete. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>Radiator Fan inoperative Go To 3</p> <p>Radiator Fan always on Go To 8</p>	All
3	<p>Turn the ignition off. Remove the Radiator Fan Relay from the PDC. Using a 12-volt test light connected to ground, check the Fused B+ circuit. Did the test light illuminate brightly?</p> <p>Yes → Go To 4</p> <p>No → Repair the Fused B+ circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

*CHECKING THE ELECTRIC RADIATOR FAN OPERATION — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Install a substitute relay in place of the Radiator Fan Relay. Turn the ignition on. With the DRB, actuate the Radiator Fan Relay. Does the Radiator Fan cycle on and off?</p> <p>Yes → Replace the Radiator Fan Relay. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Remove the Radiator Fan Relay from the PDC. Disconnect the Radiator Fan harness connector. Connect a fused jumper wire between the Fused B+ circuit cavity and the Radiator Fan Relay Output circuit cavity in the Radiator Fan Relay connector. Using a 12-volt test light connected to ground, check the Radiator Fan Relay Output circuit in the Radiator Fan harness connector. Did the test light illuminate brightly?</p> <p>Yes → Go To 6</p> <p>No → Repair the Radiator Fan Relay Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
6	<p>Turn the ignition off. Disconnect the Radiator Fan harness connector. Using a 12-volt test light connected to 12-volts, check the Radiator Fan Ground circuit. Did the test light illuminate brightly?</p> <p>Yes → Go To 7</p> <p>No → Repair the Radiator Fan Ground circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
7	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Radiator Fan. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
8	<p>Turn the ignition off. Remove the Radiator Fan Relay from the PDC. Disconnect the Radiator Fan harness connector. Turn the ignition on. Measure the voltage of the Radiator Fan Relay Output circuit. Is the voltage above 0.5 volt?</p> <p>Yes → Repair the Radiator Fan Relay Output circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Replace the Radiator Fan Relay. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:***CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR CALIBRATION****POSSIBLE CAUSES**

ECT SENSOR - COLD

ECT SENSOR - HOT

TEST	ACTION	APPLICABILITY
1	<p>NOTE: The thermostat must be operating correctly for this test to be valid. With the DRB, read and note the engine coolant temperature. Using a temperature probe, measure the engine block temperature near the ECT Sensor. Are the readings within 7°C (13°F) of each other?</p> <p>Yes → Go To 2</p> <p>No → Replace the Engine Coolant Temperature Sensor. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
2	<p>NOTE: The thermostat must be operating correctly for this test to be valid. Start the engine. Using a temperature probe, measure the engine block temperature near the ECT Sensor. When the engine temperature reaches 75°C (180°F), use the DRB and read the engine coolant temperature. Are the readings within 7°C (13°F) of each other?</p> <p>Yes → Test Complete.</p> <p>No → Replace the Engine Coolant Temperature Sensor. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:

*CHECKING THE ENGINE MECHANICAL SYSTEMS

POSSIBLE CAUSES
CHECKING ENGINE MECHANICAL SYSTEMS

TEST	ACTION	APPLICABILITY
1	<p>NOTE: The following items should be checked as a possible cause of a Driveability or No-Start problem.</p> <p>Engine Valve Timing - must be within specification Engine Compression - must be within specifications Camshaft Lobes - check for abnormal wear Engine Speed Sensor Pick-Up - check the flywheel slots for debris and deterioration Engine Exhaust System - must be free of any restriction Engine Drive Sprocket - must be properly positioned Power Brake Booster - must be free of any vacuum leaks Fuel - must be free of contamination Fuel Injector - must not be plugged or restricted Fuel Injection Pump - must be properly timed</p> <p>NOTE: Check for any Technical Service Bulletins that may relate to the problem.</p> <p>Are there any problems evident?</p> <p>Yes → Repair as necessary. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Test Complete.</p>	All

Symptom:***CHECKING THE FUEL COMPUTER**

POSSIBLE CAUSES	
ECM - FUEL COMPUTER OUTPUT CIRCUIT	
FUEL COMP OUPUT CIRCUIT SHORTED TO VOLTAGE	
FUEL COMPUTER OUTPUT CIRCUIT OPEN	
FUEL COMPUTER OUTPUT CIRCUIT SHORT TO GROUND	
OVERHEAD CONSOLE	
PCM	
PCM - FUEL COMPUTER OUTPUT CIRCUIT	

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the ECM harness connectors. Turn the ignition on. Measure the voltage of the Fuel Computer Output circuit at the ECM harness connector. Is the voltage between 4.5 and 5.5 volts? Yes → Go To 2 Below 4.5 volts Go To 4 Above 5.5 volts Repair the Fuel Computer Output circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2.	All
2	Turn the ignition off. Disconnect the ECM harness connectors. Turn the ignition on. Connect a jumper wire between ground and ECM harness connector C1 cavity 18 while observing the Overhead Fuel Computer. Did the Overhead Fuel Computer status change? Yes → Replace the ECM in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 3	All
3	Turn the ignition off. Disconnect the ECM harness connectors. Turn the ignition on. Connect one end of a jumper wire to ECM harness connector C1 cavity 18 while observing the Overhead Fuel Computer. With the DRB, select Body System and monitor PCI Bus Info while connecting and disconnecting the other end of the jumper wire to ground. Does the DRB display a change in Fuel Computer Status? Yes → Replace the Overhead Console in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Test Complete.	All

*CHECKING THE FUEL COMPUTER — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the PCM and ECM harness connectors. Measure the resistance of the Fuel Computer Output circuit between the ECM and PCM harness connectors. Is the resistance below 10.0 ohms?</p> <p>Yes → Go To 5</p> <p>No → Repair the Fuel Computer Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
5	<p>Turn the ignition off. Disconnect the PCM and ECM harness connectors. Measure the resistance between ground and the Fuel Computer Output circuit. Is the resistance below 100.0 ohms?</p> <p>Yes → Repair the Fuel Computer Output circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Replace the PCM in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:***CHECKING THE FUEL HEATER OPERATION****POSSIBLE CAUSES**

FUEL HEATER RELAY

FUEL HEATER RELAY OUTPUT CIRCUIT OPEN

FUEL HEATER RESISTANCE

FUSED B+ CIRCUIT OPEN

GROUND CIRCUIT OPEN

IGNITION SWITCH OUTPUT CIRCUIT OPEN

RELAY GROUND CIRCUIT OPEN

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Fuel Heater harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, check the Fuel Heater Relay Output circuit at the Fuel Heater harness connector. Is the test light on? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition off. Disconnect the Fuel Heater harness connector. Turn the ignition on. Using a 12-volt test light connected to 12-volts, check the Ground circuit at the Fuel Heater harness connector. Is the test light on? Yes → Go To 3 No → Repair the Ground circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
3	Turn the ignition off. Disconnect the Fuel Heater harness connector. Turn the ignition on. With the DRB, read the Fuel Temperature Sensor. NOTE: The Fuel temperature must be below 4.5°C (40°F). Measure the resistance of the Fuel Heater. Is the resistance between 0.7 and 2.0 ohms? Yes → Test Complete. No → Replace the Fuel Heater. Perform ROAD TEST VERIFICATION - VER-2.	All

*CHECKING THE FUEL HEATER OPERATION — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Install a substitute relay in place of the Fuel Heater Relay. Disconnect the Fuel Heater harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, check the Fuel Heater Relay Output circuit. Is the test light on?</p> <p>Yes → Replace the initial Fuel Heater Relay. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Remove the Fuel Heater Relay. Using a 12-volt test light connected to ground, check the Fused B+ circuit. Is the test light on?</p> <p>Yes → Go To 6</p> <p>No → Repair the Fused B+ circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
6	<p>Turn the ignition off. Remove the Fuel Heater Relay. Turn the ignition on. Using a 12-volt test light connected to ground, check the Ignition Switch Output circuit. Is the test light on?</p> <p>Yes → Go To 7</p> <p>No → Repair the Ignition Switch Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
7	<p>Turn the ignition off. Remove the Fuel Heater Relay. Turn the ignition on. Using a 12-volt test light connected to 12-volts, check the Ground circuit at the Fuel Heater Relay connector. Is the test light on?</p> <p>Yes → Repair the Fuel Heater Relay Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Repair the Ground circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:***CHECKING THE FUEL INJECTION PUMP****POSSIBLE CAUSES****CHECKING THE FUEL INJECTION PUMP**

TEST	ACTION	APPLICABILITY
1	<p>NOTE: This test should be performed before replacing the ECM during fault code diagnostics.</p> <p>NOTE: This test checks for shorted circuits internal to the Fuel Injection Pump assembly.</p> <p>Turn the ignition off.</p> <p>Disconnect the Fuel Injection Pump 10-way harness connector.</p> <p>NOTE: The following resistance measurements are performed on the Fuel Injection Pump 10-way harness connector (pump side). Resistance on these measurements should be greater than 100.0 ohms each.</p> <p>Measure the resistance between cavity 1 and cavities 4, 5, 6, 7, 8, 9, 10 and case ground.</p> <p>Measure the resistance between cavity 4 and cavities 5, 6, 8, 9, 10 and case ground.</p> <p>Measure the resistance between cavity 5 and cavities 6, 7, 8 and case ground.</p> <p>Measure the resistance between cavity 6 and cavities 7, 8, 9 and 10.</p> <p>Measure the resistance between cavity 7 and cavities 8, 9, 10 and case ground.</p> <p>Is the resistance below 100.0 ohms for any of the measurements?</p> <p>Yes → Replace the Fuel Injection Pump Assembly in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Test Complete.</p>	All

Symptom:

*CHECKING THE FUEL LEVEL GAUGE OPERATION

POSSIBLE CAUSES
FUEL LEVEL SENSOR
FUEL LEVEL SENSOR SIGNAL CIRCUIT OPEN
FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO SENSOR GROUND
INSTRUMENT CLUSTER

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. With the DRB, perform the Instrument Cluster Self Test. NOTE: The 5 calibration points are: #1 Empty Stop, #2 Empty, #3 1/2 Full, #4 Full, #5 Full Stop. Observe the gauge during the Self Test and compare the readings with the readings described in the NOTE. NOTE: With the DRB ensure there are no PCM Fuel Level Sensor DTCs. If there are DTCs, they must be repaired before continuing. Did the gauge reach the proper calibration points?</p> <p>Yes → Go To 2</p> <p>No → Replace the Instrument Cluster. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
2	<p>Turn the ignition off. Disconnect the Fuel Level Sensor harness connector. Disconnect the PCM harness connectors. Measure the resistance of the Fuel Level Sensor Signal circuit. Is the resistance below 10.0 ohms?</p> <p>Yes → Go To 3</p> <p>No → Repair the Fuel Level Sensor Signal circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
3	<p>Turn the ignition off. Disconnect the Fuel Level Sensor harness connector. Disconnect the PCM harness connectors. Measure the resistance between ground and the Fuel Level Sensor Signal circuit. Is the resistance below 1000.0 ohms?</p> <p>Yes → Repair the Fuel Level Sensor Signal circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 4</p>	All

***CHECKING THE FUEL LEVEL GAUGE OPERATION — Continued**

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the Fuel Level Sensor harness connector. Disconnect the PCM harness connectors. Measure the resistance between Sensor Ground and the Fuel Level Sensor Signal circuit. Is the resistance below 1000.0 ohms?</p> <p>Yes → Repair the Fuel Level Sensor Signal circuit for a short to Sensor Ground. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Completely drain the fuel tank. Refer to Service Information for proper procedure. NOTE: It is necessary to know the fuel tank capacity for this test. Fill the fuel tank to 1/4 of its capacity then turn the ignition on and note the instrument cluster fuel gauge reading. Turn the ignition off. Fill the fuel tank to 3/4 of its capacity then turn the ignition on and note the instrument cluster fuel gauge reading. Does the Fuel Gauge read the fuel tank levels accurately?</p> <p>Yes → Test Complete.</p> <p>No → Replace the Fuel Level Sensor. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:

*CHECKING THE FUEL TEMPERATURE SENSOR CALIBRATION

POSSIBLE CAUSES
FUEL TEMPERATURE SENSOR - COLD
FUEL TEMPERATURE SENSOR - HOT

TEST	ACTION	APPLICABILITY
1	<p>Disconnect the Fuel Heater harness connector.</p> <p>With the DRB, monitor the engine coolant temperature and fuel temperature. Start and idle the engine until engine temperature reaches 70°C (160°F).</p> <p>NOTE: If the engine temperature is above 70°C (160°F), allow the engine to cool down to 70°C (160°F).</p> <p>Is the fuel temperature between 20°C (70°F) and 50°C (120°F)?</p> <p>Yes → Go To 2</p> <p>No → Replace the Fuel Injection Pump Assembly in accordance with the Service Information.</p> <p>Perform ROAD TEST VERIFICATION - VER-2.</p>	All
2	<p>Disconnect the Fuel Heater harness connector.</p> <p>With the DRB, monitor the engine coolant temperature and fuel temperature. Start and idle the engine until engine temperature reaches 70°C (160°F).</p> <p>NOTE: If the engine temperature is above 70°C (160°F), allow the engine to cool down to 70°C (160°F).</p> <p>Start the engine and allow engine to reach operating temperature of 90°C (195°F).</p> <p>Does the Fuel Temperature increase smoothly to 40-60°C (100-140°F)?</p> <p>Yes → Test Complete.</p> <p>No → Replace the Fuel Injection Pump Assembly in accordance with the Service Information.</p> <p>Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:***CHECKING THE GLOW PLUG LAMP OPERATION**

POSSIBLE CAUSES	
ACTUATE THE GLOW PLUG LAMP WITH THE DRB	
MESSAGE CENTER - LAMP NEVER ON	
MESSAGE CENTER - LAMP ON CONTINUOUSLY	
ENGINE CONTROL MODULE - FAILS TO ACTIVATE LAMP	
ENGINE CONTROL MODULE - LAMP ON CONTINUOUSLY	
GLOW PLUG LAMP CONTROL CIRCUIT SHORTED TO GROUND	
GLOW PLUG LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE	
GLOW PLUG LAMP CONTROL CIRCUIT OPEN	
MESSAGE CENTER IGNITION FEED OPEN	
GLOW PLUG LAMP BULB	

TEST	ACTION	APPLICABILITY
1	Turn the ignition on and observe the Glow Plug Lamp. Did the Glow Plug Lamp illuminate and stay on longer than 20 seconds? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition off. Disconnect the ECM harness connectors. Turn the ignition on. Is the Glow Plug Lamp on? Yes → Go To 3 No → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All
3	Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the ECM harness connectors. Measure the resistance between ground and the Glow Plug Lamp Control circuit. Is the resistance above 100 kohms? Yes → Replace the Message Center. Perform ROAD TEST VERIFICATION - VER-2. No → Repair the Glow Plug Lamp Control circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.	All
4	Turn the ignition on. With the DRB, actuate the Glow Plug Lamp. Does the Glow Plug Lamp cycle on and off? Yes → The Glow Plug Lamp System is operating properly. Test complete. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 5	All

*CHECKING THE GLOW PLUG LAMP OPERATION — Continued

TEST	ACTION	APPLICABILITY
5	<p>Turn the ignition off. Disconnect the ECM harness connectors. Turn the ignition on. Connect a jumper wire between ground and the Glow Plug Lamp Control circuit in the ECM C1 harness connector. Is the Glow Plug Lamp on?</p> <p>Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the Message Center harness connector. Remove the ASD/Diesel Power Relay from the PDC. Connect a jumper wire between ASD/Diesel Power Relay connector cavities 30 and 87 (in PDC). Turn the ignition on. Measure the voltage of the Glow Plug Lamp Control circuit. Is the voltage below 0.5 volt?</p> <p>Yes → Go To 7</p> <p>No → Repair the Glow Plug Lamp Control circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
7	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the Message Center harness connector. Measure the resistance of the Glow Plug Lamp Control circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 8</p> <p>No → Repair the Glow Plug Lamp Control circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
8	<p>Turn the ignition off. Disconnect the Message Center harness connector. Turn the ignition on. Measure the voltage of the Ignition Feed circuit. Is the voltage above 10.0 volts?</p> <p>Yes → Go To 9</p> <p>No → Repair the Ignition Feed circuit to the Message Center for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
9	<p>Turn the ignition off. Remove and inspect the Glow Plug Lamp bulb from the Message Center. Is the bulb OK?</p> <p>Yes → Replace the Message Center. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Replace the Glow Plug Lamp bulb. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:

***CHECKING THE GLOW PLUG OPERATION**

POSSIBLE CAUSES
CHECKING THE GLOW PLUGS
FUSED B+ CIRCUIT OPEN
GLOW PLUG RELAY
GLOW PLUG RELAY OUTPUT CIRCUIT OPEN

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition off. Disconnect all four Glow Plug connectors. Turn the ignition on. With the DRB, actuate Glow Relay #1. Using a 12-volt test light connected to ground, probe each Glow Plug connector. Does the test light cycle on and off for each Glow Plug connector during actuator test?</p> <p>Yes → Go To 2 No → Go To 3</p>	All
2	<p>Refer to the Service Information and perform the Glow Plug Test. Are all the Glow Plugs operating properly?</p> <p>Yes → Test Complete. No → Replace the Glow Plug(s) as necessary in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
3	<p>Remove the Glow Plug Relay from the PDC. Turn the ignition on. Using a 12-volt test light connected to ground, check the Fused B+ circuit in the Glow Plug Relay connector in the PDC. Is the test light on?</p> <p>Yes → Go To 4 No → Repair the Fused B+ circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
4	<p>Turn the ignition off. Disconnect all the Glow Plug connectors. Remove the Glow Plug Relay from the PDC. Connect a jumper wire across the Glow Plug Relay connector cavities 30 and 87. Using a 12-volt test light connected to ground, check each Glow Plug Relay Output circuit at each Glow Plug connector. Is the test light on at each of the Glow Plug connectors?</p> <p>Yes → Replace the Glow Plug Relay. Perform ROAD TEST VERIFICATION - VER-2. No → Repair the Glow Plug Relay Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:

*CHECKING THE LOW COOLANT LAMP OPERATION

POSSIBLE CAUSES
CHECK THE LOW COOLANT SWITCH
POWERTRAIN CONTROL MODULE - CONTROL OPEN
POWERTRAIN CONTROL MODULE - CONTROL SHORTED TO GROUND
LOW COOLANT LAMP CONTROL SHORTED TO VOLTAGE
LOW COOLANT SWITCH SIGNAL CIRCUIT OPEN
LOW COOLANT SWITCH SIGNAL CIRCUIT SHORTED TO GROUND
LOW COOLANT LAMP CONTROL CIRCUIT SHORTED TO GROUND
LOW COOLANT SWITCH - OPEN
LOW COOLANT SWITCH SIGNAL CIRCUIT SHORTED TO SWITCH GROUND
LOW COOLANT LAMP CONTROL CIRCUIT OPEN
LOW COOLANT SWITCH - INTERNAL SHORT
POWERTRAIN CONTROL MODULE - SIGNAL OPEN
LOW COOLANT LAMP BULB
POWERTRAIN CONTROL MODULE - SIGNAL SHORT TO GROUND
MESSAGE CENTER

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure the engine coolant is at the proper level before continuing. Turn the ignition on and observe the Low Coolant Lamp. Select the outcome of this operation.</p> <p>Lamp on for 2 seconds, then off Go To 2</p> <p>Lamp on continuously Go To 7</p> <p>Lamp inoperative Go To 12</p>	All
2	<p>Turn the ignition off. Remove the coolant from the coolant reservoir. Turn the ignition on. Did the Low Coolant Lamp illuminate and stay on?</p> <p>Yes → The Low Coolant Lamp System is working properly. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 3</p>	All

***CHECKING THE LOW COOLANT LAMP OPERATION — Continued**

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the Low Coolant Switch harness connector. Measure the resistance between ground and the Low Coolant Switch Signal circuit. Is the resistance above 100 kohms? Yes → Go To 4 No → Repair the Low Coolant Switch Signal circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.	All
4	Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the Low Coolant Switch harness connector. Measure the resistance between the Low Coolant Switch Signal circuit and Switch Ground circuit. Is the resistance above 100 kohms? Yes → Go To 5 No → Repair the Low Coolant Switch Signal and Switch Ground circuit for a short together. Perform ROAD TEST VERIFICATION - VER-2.	All
5	Turn the ignition off. Disconnect the Low Coolant Switch harness connector. Turn the ignition on and wait 30 seconds. Is the Low Coolant Lamp on? Yes → Replace the Low Coolant Switch. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 6	All
6	If there are no possible causes remaining, view repair. Repair Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All
7	Turn the ignition off. Disconnect the PCM harness connectors. Turn the ignition on and observe the Low Coolant Lamp. Did the Low Coolant Lamp illuminate and stay on continuously? Yes → Go To 8 No → Go To 9	All

*CHECKING THE LOW COOLANT LAMP OPERATION — Continued

TEST	ACTION	APPLICABILITY
8	<p>Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the Message Center harness connector. Measure the resistance between ground and the Low Coolant Lamp Control circuit. Is the resistance above 100 kohms?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Repair the Low Coolant Lamp Control circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
9	<p>Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the Low Coolant Switch harness connector. Measure the resistance of the Low Coolant Switch Signal circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 10</p> <p>No → Repair the Low Coolant Switch Signal circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
10	<p>NOTE: Ensure the PCM harness connectors are connected. Disconnect the Low Coolant Switch harness connector. Connect a high impedance test light between the Low Coolant Switch harness connector cavities. Turn the ignition on. After 30 seconds, is the Low Coolant Lamp on steady?</p> <p>Yes → Go To 11</p> <p>No → Replace the Low Coolant Switch. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
11	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
12	<p>Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the Message Center harness connector. Turn the ignition on. Measure the voltage of the Low Coolant Lamp Control circuit. Is the voltage above 0.5 volt?</p> <p>Yes → Repair the Low Coolant Lamp Control circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 13</p>	All

***CHECKING THE LOW COOLANT LAMP OPERATION — Continued**

TEST	ACTION	APPLICABILITY
13	Turn the ignition off. Disconnect the PCM harness connectors. Connect a jumper wire between the Low Coolant Lamp Control circuit and ground. Turn the ignition on. Is the Low Coolant Lamp illuminated? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 14	All
14	Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the Message Center harness connector. Measure the resistance of the Low Coolant Lamp Control circuit. Is the resistance below 5.0 ohms? Yes → Go To 15 No → Repair the Low Coolant Lamp Control circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
15	Turn the ignition off. Remove the Message Center. Remove and inspect the Low Coolant Lamp bulb. Is the bulb OK? Yes → Go To 16 No → Replace the Low Coolant Lamp bulb. Perform ROAD TEST VERIFICATION - VER-2.	All
16	If there are no possible causes remaining, view repair. Repair Replace the Message Center. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:

*CHECKING THE OIL PRESSURE GAUGE OPERATION

POSSIBLE CAUSES
CHECK FOR OTHER DTCS
POWERTRAIN CONTROL MODULE
POWERTRAIN CONTROL MODULE - SENSOR GROUND SHORTED TO VOLTAGE
INSTRUMENT CLUSTER
CHECK ENGINE OIL PRESSURE WITH EXTERNAL GAUGE
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
5-VOLT SUPPLY CIRCUIT SHORTED TO SENSOR GROUND
5-VOLT SUPPLY CIRCUIT OPEN
ENGINE OIL PRESSURE SENSOR
POWERTRAIN CONTROL MODULE - 5-VOLT SUPPLY CIRCUIT LOW
SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. With the DRB, check for Oil Pressure Sensor related DTCS. Are any Oil Pressure Sensor DTCS present?</p> <p>Yes → Refer to symptom list for problems related to Oil Pressure Sensor DTCS. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 2</p>	All
2	<p>CAUTION: Ensure the engine oil is at the proper level before proceeding. Start the engine. With the DRB in Sensors, read the Oil Pressure Sensor voltage. Is the voltage between 1.0 and 4.0 volts?</p> <p>Yes → Go To 3</p> <p>No → Go To 4</p>	All
3	<p>Turn the ignition off, wait 30 seconds, then turn the ignition on. With the DRB, select BODY from the SYSTEM menu, then select ELECTRO/MECH CLUSTER (MIC), ACTUATOR TESTS and SELF TEST. Perform the Instrument Cluster Self Test. Observe the Oil Pressure Gauge. NOTE: The Oil Pressure Gauge should stop at 0 Bar (0 PSI), 3.0 Bar (40 PSI), 5.0 Bar (80 PSI) and 8.3 Bar (120 PSI). Did the gauge reach the proper calibration points?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Replace the Instrument Cluster in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

***CHECKING THE OIL PRESSURE GAUGE OPERATION — Continued**

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Connect a 8.3 Bar (120 PSI) oil pressure gauge to the engine. Start the engine. Observe the mechanical oil pressure gauge. Is the engine oiling system functioning properly? Yes → Go To 5 No → Repair the engine oiling system in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All
5	Turn the ignition off. Disconnect the Engine Oil Pressure Sensor harness connector. Turn the ignition on. Measure the voltage of the 5-volt Supply circuit in the Engine Oil Pressure Sensor harness connector. Is the voltage between 4.8 and 5.5 volts? Yes → Go To 6 No → Go To 8	All
6	Turn the ignition off. Disconnect the Engine Oil Pressure Sensor harness connector. Measure the voltage on the Sensor Ground circuit. Is the voltage below 0.5 volt? Yes → Replace the Engine Oil Pressure Sensor. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 7	All
7	Turn the ignition off. Disconnect the Engine Oil Pressure Sensor harness connector. Disconnect the PCM harness connectors. Turn the ignition on. Measure the voltage of the Sensor Ground circuit. Is the voltage below 0.5 volt? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Repair the Sensor Ground circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2.	All
8	Turn the ignition off. Disconnect the Engine Oil Pressure Sensor harness connector. Disconnect the PCM harness connectors. Measure the resistance between ground and the 5-volt Supply circuit. Is the resistance above 100 kohms? Yes → Go To 9 No → Repair the 5-volt Supply circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.	All

*CHECKING THE OIL PRESSURE GAUGE OPERATION — Continued

TEST	ACTION	APPLICABILITY
9	<p>Turn the ignition off. Disconnect the Engine Oil Pressure Sensor harness connector. Disconnect the PCM harness connectors. Measure the resistance between the 5-volt Supply circuit and the Sensor Ground circuit in the Engine Oil Pressure Sensor harness connector. Is the resistance above 100 kohms?</p> <p>Yes → Go To 10</p> <p>No → Repair the 5-volt Supply circuit for a short to the Sensor Ground circuit. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
10	<p>Turn the ignition off. Disconnect the Engine Oil Pressure Sensor harness connector. Disconnect the PCM harness connectors. Measure the resistance of the 5-volt Supply circuit between the Engine Oil Pressure Sensor harness connector and the PCM C1 harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 11</p> <p>No → Repair the 5-volt Supply circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
11	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:***CHECKING THE SPEEDOMETER OPERATION****POSSIBLE CAUSES**

CHECK FOR VEHICLE SPEED SENSOR DTCS
 CHECK GAUGES AND OTHER LAMPS AT KEY ON
 COMPARE THE DRB VEHICLE SPEED WITH THE SPEEDOMETER
 INSTRUMENT CLUSTER
 POWERTRAIN CONTROL MODULE - 5-VOLT OPEN
 POWERTRAIN CONTROL MODULE - INTERNAL FAULT
 5-VOLT SUPPLY CIRCUIT OPEN
 CHECK VSS CIRCUITS FOR A SHORT TO VOLTAGE
 CHECK VSS CIRCUITS FOR A SHORT TO GROUND
 CHECK VSS CIRCUITS FOR A SHORT TOGETHER
 CHECK VSS CIRCUITS FOR AN OPEN
 VEHICLE SPEED SENSOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition on and observe gauge and lamp operation during bulb check. Did the gauges and other lamps operate properly during the bulb check? Yes → Go To 2 No → Refer to symptom list for problems related to Vehicle Communication. Perform ROAD TEST VERIFICATION - VER-2.	All
2	Turn the ignition on. With the DRB, read ECM DTCs. Are any Vehicle Speed Sensor DTCs present? Yes → Refer to symptom list for problems related to Vehicle Speed Sensor DTCs before continuing. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 3	All
3	With the DRB, monitor Vehicle Speed in the PCM Sensor Display menu. Test drive the vehicle and observe the Vehicle Speed on the DRB. Does the Vehicle Speed reading on the DRB increase with vehicle speed? Yes → Go To 4 No → Go To 6	All

*CHECKING THE SPEEDOMETER OPERATION — Continued

TEST	ACTION	APPLICABILITY
4	<p>With the DRB, monitor Vehicle Speed in the PCM Sensor Display menu. Test drive the vehicle and observe the Vehicle Speed on the DRB. Compare the DRB reading with the vehicle's Speedometer. Are the readings within 5 km/h (3 MPH) of each other?</p> <p>Yes → The Speedometer System is working properly. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 5</p>	All
5	<p>With the DRB, select BODY from the Systems menu, ELECTRO/MECH INSTRUMENT CLUSTER, MONITOR DISPLAY, then CCD BUS ENGINE INFO. Monitor Vehicle Speed while driving the vehicle. Does the Vehicle Speed Sensor reading increase with vehicle speed?</p> <p>Yes → Replace the Instrument Cluster in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
6	<p>Turn the ignition off. Disconnect the Vehicle Speed Sensor harness connector. Check connectors - Clean/repair as necessary Turn the ignition on. Measure the voltage of the 5-volt Supply circuit in the Vehicle Speed Sensor harness connector. Is the voltage above 4.5 volts?</p> <p>Yes → Go To 7</p> <p>No → Go To 12</p>	All
7	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the PCM harness connectors. Turn the ignition on. Disconnect the Vehicle Speed Sensor harness connector. Measure the voltage between ground and Vehicle Speed Sensor harness connector cavities 1, 2, and 3. Is the voltage below 1.0 volt on each circuit?</p> <p>Yes → Go To 8</p> <p>No → Repair the circuit that measured above 1.0 volt for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

***CHECKING THE SPEEDOMETER OPERATION — Continued**

TEST	ACTION	APPLICABILITY
8	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the PCM harness connectors. Disconnect the Vehicle Speed Sensor harness connector. Measure the resistance between ground and Vehicle Speed Sensor harness connector cavities 1, 2, and 3. Is the resistance above 100 kohms on each circuit?</p> <p>Yes → Go To 9</p> <p>No → Repair the circuit that measured below 100 kohms for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
9	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the PCM harness connectors. Disconnect the Vehicle Speed Sensor harness connector. Measure the resistance between VSS harness connector cavity 1 and cavities 2 and 3, then between cavity 2 and 3. Is the resistance above 100 kohms for each measurement?</p> <p>Yes → Go To 10</p> <p>No → Repair the circuit that measured below 100 kohms for a short together. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
10	<p>Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the Vehicle Speed Sensor harness connector. Measure the resistance of the Vehicle Speed Sensor Signal circuit. Measure the resistance of the Vehicle Speed Sensor Ground circuit. Is the resistance below 5.0 ohms for each measurement?</p> <p>Yes → Go To 11</p> <p>No → Repair the circuit that measured above 5.0 ohms for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
11	<p>If there are no possible causes remaining, view repair.</p> <p>Yes → Replace the Vehicle Speed Sensor. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
12	<p>Turn the ignition off. Disconnect the Vehicle Speed Sensor harness connector. Disconnect the PCM C2 harness connector. Check connectors - Clean/repair as necessary Measure the resistance of the 5-volt Supply circuit between the Vehicle Speed Sensor harness connector and the PCM C2 harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Repair the 5-volt Supply circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:

*CHECKING THE TACHOMETER OPERATION

POSSIBLE CAUSES
CHECK OPERATION OF OTHER GAUGES
INSTRUMENT CLUSTER - INOPERATIVE TACHOMETER
ENGINE CONTROL MODULE - INCORRECT SIGNAL PROCESSING
ENGINE SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
ENGINE SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
ENGINE SPEED SENSOR SIGNAL CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. Observe gauge and bulb operation during cluster initialization check. Do the other gauges operate properly?</p> <p>Yes → Go To 2</p> <p>No → Refer to symptom list for problems related to Instrument Cluster Communication. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
2	<p>Turn the ignition off. Disconnect the ECM harness connectors. Remove the ASD/Diesel Power Relay from the PDC. Connect a jumper wire between ASD/Diesel Power Relay connector cavities 30 and 87 (in PDC). Turn the ignition on. Measure the voltage on the Engine Speed Sensor Signal circuit. Is the voltage between 4.0 and 6.0 volts?</p> <p>Yes → Go To 3</p> <p>No → Go To 5</p>	All
3	<p>Start the engine. With the DRB, select Body from the Systems menu, Electro/Mech Cluster (MIC), Monitor Display, then PCI Bus Engine Info. Monitor the DRB and Instrument Cluster Tachometer engine speed with the engine idling, then raise the engine speed to 2500 RPM and release it back to idle. NOTE: The DRB engine speed should be approximately 850 RPM at idle, increase with actual engine speed and match the Instrument Cluster Tachometer reading. Did the Instrument Cluster Tachometer perform as it should?</p> <p>Yes → Go To 4</p> <p>No → Replace the Instrument Cluster in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

***CHECKING THE TACHOMETER OPERATION — Continued**

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. NOTE: Ensure the ECM harness connectors are connected. Start the engine. With a voltmeter set to measure frequency (Hz), measure the frequency of the Engine Speed Sensor Signal circuit by back probing ECM C1 cavity 6. Is the frequency between 26.0 and 34.0 Hz at idle?</p> <p>Yes → Test Complete.</p> <p>No → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
5	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the PCM harness connectors. Turn the ignition on. Measure the voltage on the Engine Speed Sensor Signal circuit. Is the voltage above 6.0 volts?</p> <p>Yes → Repair the Engine Speed Sensor Signal circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the PCM harness connectors. Measure the resistance between ground and the Engine Speed Sensor Signal circuit. Is the resistance above 100 kohms?</p> <p>Yes → Go To 7</p> <p>No → Repair the Engine Speed Sensor Signal circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
7	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the PCM harness connectors. Measure the resistance of the Engine Speed Sensor Signal circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 8</p> <p>No → Go To 8</p>	All
8	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:

***CHECKING THE TURBOCHARGER BOOST PRESSURE SENSOR CALIBRATION**

POSSIBLE CAUSES

TURBOCHARGER BOOST PRESSURE SENSOR CALIBRATION

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, select Engine, Bosch then Sensors. Read the Boost Pressure Voltage. Is the Boost Pressure Voltage between 1.70 and 1.95 volts? Yes → Test Complete. No → Replace the Turbocharger Boost Pressure Sensor. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:***CHECKING THE TURBOCHARGER OPERATION**

POSSIBLE CAUSES
CHECKING THE TURBOCHARGER HOSES
CHECKING THE WASTEGATE HOSE
TURBOCHARGER
WASTEGATE ACTUATOR ARM OPERATION
WASTEGATE RESTRICTION

TEST	ACTION	APPLICABILITY
1	<p>NOTE: The exhaust system must be free from any restriction to perform this test.</p> <p>Check the turbocharger outlet hose between the turbocharger and the intake manifold and the turbocharger inlet hose between the turbocharger and the air cleaner for loose connection, damage or restriction.</p> <p>Are any of these conditions evident?</p> <p>Yes → Repair or replace as necessary. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 2</p>	All
2	<p>Check the wastegate actuator supply hose for loose connection, damage or restriction.</p> <p>Are any of these conditions evident?</p> <p>Yes → Repair or replace as necessary. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 3</p>	All
3	<p>Disconnect the Wastegate Actuator Supply Hose from the intake manifold.</p> <p>Using an air pressure regulator, connect an air hose to the disconnected end of the Wastegate Actuator Supply Hose.</p> <p>Start at 0 kPa (0 PSI) and slowly increase air pressure to 310 kPa (45 PSI) while monitoring the Wastegate Actuator Arm.</p> <p>NOTE: The Wastegate Actuator Arm should remain closed until air pressure reaches 117-138 kPa (17-20 PSI) and fully open when the air pressure reaches 234-276 kPa (34-40 PSI).</p> <p>Did the Wastegate Actuator unseat and fully open as described?</p> <p>Yes → Go To 4</p> <p>No → Go To 5</p>	All

*CHECKING THE TURBOCHARGER OPERATION — Continued

TEST	ACTION	APPLICABILITY
4	<p>Connect an air pressure gauge in-line with the Wastegate Actuator Supply Hose. NOTE: Air pressure gauge must be rated above 276 kPa (40 PSI). NOTE: The vehicle must be on flat level ground to perform this test. Failure to drive vehicle on flat level ground could result in incorrect boost pressure readings. NOTE: FIRST GEAR - The following numbers are a comparison of Boost Pressure and Engine Speed (PSI/RPM) for the First Gear test: 21 kPa (3 PSI)/1500rpm - 28 kPa (4 PSI)/2000rpm - 48 kPa (7 PSI)/2500rpm - 69 kPa (10 PSI)/3000rpm - 90 kPa (13 PSI)/3500rpm NOTE: SECOND GEAR - The following numbers are a comparison of Boost Pressure and Engine Speed (PSI/RPM) for the Second Gear test: 28 kPa (4 PSI)/1500rpm - 28 kPa (4 PSI)/2000rpm - 48 kPa (7 PSI)/2500rpm - 76 kPa (11 PSI)/3000rpm - 97 kPa (14 PSI)/3500rpm Test drive the vehicle in First gear. Increase engine RPM in 500 RPM increments slowly until engine speed is 3500 RPM. Note the Air Pressure Gauge reading at each 500 RPM increment. Repeat this step with the vehicle in Second Gear. Compare the two sets of readings to the appropriate GEAR NOTE. Do the Air Pressure Gauge readings match the values indicated in the NOTE [00b1] 14 kPa (2 PSI)?</p> <p>Yes → Test Complete.</p> <p>No → Replace the Turbocharger Assembly in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
5	<p>Remove the E-clip and disconnect the Wastegate Actuator Rod from the Wastegate Actuator Arm. Manually move the Wastegate Actuator Arm from closed to fully open. Does the Wastegate Actuator Arm move easily without restriction?</p> <p>Yes → Replace the Wastegate Actuator in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Clean Wastegate Actuator Arm or Wastegate Actuator Shaft as necessary. If OK, replace Turbocharger Assembly in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:

***CHECKING THE VEHICLE SPEED SIGNAL**

POSSIBLE CAUSES	
VEHICLE SPEED SENSOR SIGNAL CIRCUIT SHORTED TO SENSOR GROUND	
CHECK FOR VSS DTC	
POWERTRAIN CONTROL MODULE - 5-VOLT SUPPLY HIGH	
POWERTRAIN CONTROL MODULE - AFTER 5-VOLT SUPPLY SHORTED TO VOLTAGE	
REPAIR THE 5-VOLT SUPPLY CIRCUIT AND CHECK THE PCM	
5-VOLT SUPPLY CIRCUIT OPEN	
POWERTRAIN CONTROL MODULE - SHORTED TO VOLTAGE	
SPEEDOMETER PINION AND DRIVE TEETH DAMAGED	
VEHICLE SPEED SENSOR SIGNAL CIRCUIT SHORTED TO 5-VOLT SUPPLY CIRCUIT	
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND	
ENGINE CONTROL MODULE - SHORTED TO VOLTAGE	
VEHICLE SPEED SENSOR SIGNAL CIRCUIT OPEN	
5-VOLT SUPPLY CIRCUIT SHORTED TO SENSOR GROUND	
VEHICLE SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND	
VEHICLE SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE	
POWERTRAIN CONTROL MODULE - 5-VOLT SUPPLY CIRCUIT LOW	
SENSOR GROUND CIRCUIT OPEN	
VEHICLE SPEED SENSOR	
ENGINE CONTROL MODULE - INTERNAL FAULT	

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB, select Engine, JTEC then Sensors. Note the Vehicle Speed reading on the DRB while test driving the vehicle. Does the DRB display an accurate vehicle speed reading? Yes → Test Complete. No → Go To 2	All
2	Turn the ignition on. With the DRB, read ECM DTCs. Are any VSS DTCs present? Yes → Refer to symptom list for problems related to VSS DTCs. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 3	All

*CHECKING THE VEHICLE SPEED SIGNAL — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Remove the Vehicle Speed Sensor. Inspect the Speedometer Pinion and drive teeth on the Output Shaft (located in the transmission). Are both components OK?</p> <p>Yes → Go To 4</p> <p>No → Repair or replace the Speedometer Pinion or internal components as necessary in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
4	<p>Turn the ignition off. Disconnect the Vehicle Speed Sensor harness connector. Check connectors - Clean/repair as necessary Turn the ignition on. Measure the voltage of the 5-volt Supply circuit in the Vehicle Speed Sensor harness connector. Is the voltage between 4.8 and 5.5 volts?</p> <p>Yes → Go To 5</p> <p>Above Go To 16</p> <p>Below Go To 18</p>	All
5	<p>Turn the ignition off. Disconnect the Vehicle Speed Sensor harness connector. Note: Check connectors - Clean/repair as necessary. Turn the ignition on. Measure the voltage of the Vehicle Speed Sensor Signal circuit. Is the voltage above 5.5 volts?</p> <p>Yes → Go To 6</p> <p>No → Go To 9</p>	All
6	<p>Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the Vehicle Speed Sensor harness connector. Note: Check connectors - Clean/repair as necessary. Turn the ignition on. Measure the voltage of the Vehicle Speed Sensor Signal circuit. Is the voltage above 5.5 volts?</p> <p>Yes → Go To 7</p> <p>No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

***CHECKING THE VEHICLE SPEED SIGNAL — Continued**

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the Vehicle Speed Sensor harness connector. Note: Check connectors - Clean/repair as necessary. Remove the ASD/Diesel Power Relay from the PDC. Connect a jumper wire between ASD/Diesel Power Relay cavities 30 and 87 (in PDC). Turn the ignition on. Measure the voltage of the Vehicle Speed Sensor Signal circuit. Is the voltage above 5.5 volts? Yes → Go To 8 No → Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All
8	If there are no possible causes remaining, view repair. Repair Repair the Vehicle Speed Sensor Signal circuit for a short to voltage. Perform ROAD TEST VERIFICATION - VER-2.	All
9	Turn the ignition off. Disconnect the Vehicle Speed Sensor harness connector. Disconnect the PCM C1 and C2 harness connectors. Note: Check connectors - Clean/repair as necessary Measure the resistance between the Vehicle Speed Sensor Signal circuit and the 5-volt Supply circuit. Is the resistance above 100 kohms? Yes → Go To 10 No → Repair the Vehicle Speed Sensor Signal circuit for a short to the 5-volt Supply circuit. Perform ROAD TEST VERIFICATION - VER-2.	All
10	Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the Vehicle Speed Sensor harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance of the Vehicle Speed Sensor Signal circuit. Is the resistance below 5.0 ohms? Yes → Go To 11 No → Repair the Vehicle Speed Sensor Signal circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
11	Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the Vehicle Speed Sensor harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance between ground and the Vehicle Speed Sensor Signal circuit. Is the resistance above 100 kohms? Yes → Go To 12 No → Repair the Vehicle Speed Sensor Signal circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.	All

*CHECKING THE VEHICLE SPEED SIGNAL — Continued

TEST	ACTION	APPLICABILITY
12	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the Vehicle Speed Sensor harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance of the Vehicle Speed Sensor Ground circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 13</p> <p>No → Repair the Vehicle Speed Sensor Ground circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
13	<p>Turn the ignition off. Disconnect the Vehicle Speed Sensor harness connector. NOTE: Ensure the ECM and PCM harness connectors are connected before continuing. Turn the ignition on. Connect a jumper wire to the Vehicle Speed Sensor Signal circuit in the VSS harness connector. With the DRB, monitor the VEHICLE SPEED while tapping the other end of the jumper wire to ground. Does the DRB display km/h (MPH) greater than 0?</p> <p>Yes → Replace the Vehicle Speed Sensor. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 14</p>	All
14	<p>Turn the ignition off. Disconnect the Vehicle Speed Sensor harness connector. Disconnect the PCM harness connectors. Check connectors - Clean/repair as necessary Measure the resistance between the Vehicle Speed Sensor Signal circuit and the Sensor Ground circuit. Is the resistance above 100 kohms?</p> <p>Yes → Go To 15</p> <p>No → Repair the Vehicle Speed Sensor Signal circuit for a short to the Sensor Ground circuit. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
15	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
16	<p>Turn the ignition off. Disconnect the Vehicle Speed Sensor harness connector. Disconnect the PCM harness connectors. Check connectors - Clean/repair as necessary Turn the ignition on. Measure the voltage between ground and the 5-volt Supply circuit. Is the voltage below 0.5 volt?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Go To 17</p>	All

***CHECKING THE VEHICLE SPEED SIGNAL — Continued**

TEST	ACTION	APPLICABILITY
17	<p>Turn the ignition off. Repair the 5-volt Supply circuit for a short to voltage. Reconnect all harness connectors except the Vehicle Speed Sensor harness connector. Turn the ignition on. Measure the voltage of the 5-volt Supply circuit. Is the voltage above 4.8 volts?</p> <p>Yes → The repair is complete. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
18	<p>Turn the ignition off. Disconnect the Vehicle Speed Sensor harness connector. Disconnect the PCM C1 harness connector. Check connectors - Clean/repair as necessary Measure the resistance of the 5-volt Supply circuit between the Vehicle Speed Sensor harness connector and the PCM C1 harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 19</p> <p>No → Repair the 5-volt Supply circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
19	<p>Turn the ignition off. Disconnect the Vehicle Speed Sensor harness connector. Disconnect the PCM harness connectors. Check connectors - Clean/repair as necessary Measure the resistance between ground and the 5-volt Supply circuit. Is the resistance above 100 kohms?</p> <p>Yes → Go To 20</p> <p>No → Repair the 5-volt Supply circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
20	<p>Turn the ignition off. Disconnect the Vehicle Speed Sensor harness connector. Disconnect the PCM harness connectors. Check connectors - Clean/repair as necessary Measure the resistance between the 5-volt Supply circuit and the Sensor Ground circuit in the Vehicle Speed Sensor harness connector. Is the resistance above 100 kohms?</p> <p>Yes → Go To 21</p> <p>No → Repair the 5-volt Supply circuit for a short to the Sensor Ground circuit. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
21	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

Symptom:

*CHECKING THE WATER IN FUEL LAMP OPERATION

POSSIBLE CAUSES
MESSAGE CENTER
PCM
PCM - WATER IN FUEL SIGNAL CIRCUIT
SENSOR GROUND OPEN
WATER IN FUEL LAMP BULB
WATER IN FUEL SENOR SIGNAL CIRCUIT OPEN
WATER IN FUEL SENSOR
WATER IN FUEL SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
WATER IN FUEL SENSOR SIGNAL CIRCUIT SHORTED TO SENSOR GROUND

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Be sure a water in fuel condition does not exist before continuing. Turn the ignition on while monitoring the Water In Fuel Lamp. Choose the appropriate answer.</p> <p>The lamp turns on and stays on. Go To 2</p> <p>The lamp turns on for 2 seconds then off Go To 5</p> <p>The lamp does not turn on at all. Go To 8</p>	All
2	<p>Turn the ignition off. Disconnect the Water In Fuel Sensor harness connector. Turn the ignition on while observing the Water In Fuel Lamp. Does the Water In Fuel Lamp turn on and stay on?</p> <p>Yes → Go To 3</p> <p>No → Replace the Water In Fuel Sensor Perform ROAD TEST VERIFICATION - VER-2.</p>	All
3	<p>Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the Water In Fuel Sensor harness connector. Measure the resistance between engine ground and the Water In Fuel Sensor Signal circuit. Is the resistance above 100 kohms?</p> <p>Yes → Go To 4</p> <p>No → Repair the Water In Fuel Sensor Signal circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.</p>	All

***CHECKING THE WATER IN FUEL LAMP OPERATION — Continued**

Symptom:**P1655-AC CONTROL OPEN CIRCUIT - DIESEL****When Monitored and Set Condition:****P1655-AC CONTROL OPEN CIRCUIT - DIESEL**

When Monitored: With the ignition on.

Set Condition: With the A/C clutch operation not requested, the ECM detects low voltage on the A/C Clutch Relay Control circuit. NOTE: AC is an option that may not be present on all vehicles.

POSSIBLE CAUSES

INTERMITTENT CONDITION

ASD/DIESEL POWER RELAY OUTPUT CIRCUIT OPEN

SUBSTITUTE A/C COMPRESSOR CLUTCH RELAY

A/C COMPRESSOR CLUTCH RELAY CONTROL CIRCUIT SHORTED TO GROUND

A/C COMPRESSOR CLUTCH RELAY CONTROL CIRCUIT OPEN

ENGINE CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. With the DRB, actuate the A/C Compressor Clutch Relay. Is the A/C Compressor Clutch Relay clicking?</p> <p>Yes → Go To 2 No → Go To 3</p> <p>NOTE: Stop the A/C Compressor Clutch Relay actuation by the DRB.</p>	All
2	<p>WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS. NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition. With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present?</p> <p>Yes → Repair as necessary Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Test Complete.</p>	All

P1655-AC CONTROL OPEN CIRCUIT - DIESEL — Continued

TEST	ACTION	APPLICABILITY
3	Turn the ignition off. Remove the A/C Compressor Clutch Relay from the PDC. Turn the ignition on. Using a 12-volt Test Light connected to ground, check the ASD/Diesel Power Relay Output circuit. Did the test light illuminate brightly? Yes → Go To 4 No → Repair the ASD/Diesel Power Relay Output circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
4	Turn the ignition off. Install a substitute relay in place of the A/C Compressor Clutch Relay. Turn the ignition on. With the DRB, actuate the A/C Compressor Clutch Relay. Is the A/C Compressor Clutch clicking? Yes → Replace the A/C Compressor Clutch Relay. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 5	All
5	Turn the ignition off. Disconnect the ECM harness connector(s). Remove the A/C Compressor Clutch Relay from the PDC. Measure the resistance between ground and the A/C Compressor Clutch Relay Control circuit. Is the resistance above 100 kohms? Yes → Go To 6 No → Repair the A/C Compressor Clutch Relay Control circuit for a short to ground. Perform ROAD TEST VERIFICATION - VER-2.	All
6	Turn the ignition off. Disconnect the ECM harness connector(s). Remove the A/C Compressor Clutch Relay from the PDC. Measure the resistance of the A/C Compressor Clutch Relay Control circuit. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the A/C Compressor Clutch Relay Control circuit for an open. Perform ROAD TEST VERIFICATION - VER-2.	All
7	If there are no possible causes remaining, view repair. Repair Replace and program the Engine Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.	All

Symptom:**P1655-AC CONTROL SHORT CIRCUIT - DIESEL****When Monitored and Set Condition:****P1655-AC CONTROL SHORT CIRCUIT - DIESEL**

When Monitored: With the ignition on.

Set Condition: The ECM detects excessive current draw on the A/C clutch relay control circuit when attempting to activate the A/C clutch. NOTE: AC is an option that may not be present on all vehicles.

POSSIBLE CAUSES

INTERMITTENT CONDITION

SUBSTITUTE A/C COMPRESSOR CLUTCH RELAY

A/C COMPRESSOR CLUTCH RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE

TEST	ACTION	APPLICABILITY
1	<p>Start the engine. With the DRB, select Engine, Bosch Controller then Sensor Display. Observe the cruise switch volts on the DRB while pressing and holding each cruise button separately. NOTE: Pressing each cruise button should result in the following voltages: ON/OFF 0.55 - 1.15v, SET 3.15 - 3.6v, RESUME/ACCEL 3.9 - 4.15v, CANCEL 1.55 - 2.05v, COAST 2.5 - 3.0v, No Button Pressed 4.4 - 4.7v Does each switch provide the correct voltage?</p> <p>Yes → Go To 2 No → Go To 23</p>	All
2	<p>Turn the ignition on. With the DRB, select Engine, Bosch and Inputs/Outputs. Observe the Brake Switch input while pressing and releasing the brake pedal several times. Does the DRB indicate the correct change of state from Released to Pressed?</p> <p>Yes → Go To 3 No → Go To 19</p>	All
3	<p>Turn the ignition on. With the DRB, select Engine, Bosch and Inputs/Outputs. Observe the Brake Switch input while pressing and releasing the brake pedal several times. Does the DRB indicate the correct change of state from Released to Pressed?</p> <p>Yes → Go To 4 No → Go To 14</p>	All
4	<p>With the DRB, select Engine, then Bosch Controller and monitor the Vehicle Speed Signal while test driving the vehicle. Does the DRB display accurate vehicle speed?</p> <p>Yes → Go To 5 No → Refer to symptom list for problems related to Vehicle Speed Sensor Signal. Perform SPEED CONTROL VERIFICATION - VER-4.</p>	All
5	<p>Drive the vehicle and generate a vehicle speed above 55 Km/h (35 mph). Attempt to set the speed control. Did vehicle speed control maintain set vehicle speed?</p> <p>Yes → Go To 6 No → Go To 12</p>	All
6	<p>Drive the vehicle and generate a vehicle speed above 55 Km/h (35 mph). Set the speed control and observe the Speed Control Lamp. Does the Speed Control Lamp illuminate when speed control is on?</p> <p>Yes → Test Complete. No → Go To 7</p>	All

SPEED CONTROL

*CHECKING THE SPEED CONTROL OPERATION — Continued

TEST	ACTION	APPLICABILITY
7	<p>Turn the ignition on. With the DRB, select Engine, JTEC then Actuators. With the DRB, actuate the S/C Lamp while observing the S/C Lamp. Is the S/C Lamp turning on and off during actuation?</p> <p>Yes → Go To 8</p> <p>No → Refer to symptom list for problems related to S/C Lamp operation. Perform SPEED CONTROL VERIFICATION - VER-4.</p>	All
8	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the PCM harness connectors. Measure the resistance of the S/C Lamp Signal circuit. Is the resistance below 10.0 ohms?</p> <p>Yes → Go To 9</p> <p>No → Repair the S/C Lamp Signal circuit for an open. Perform SPEED CONTROL VERIFICATION - VER-4.</p>	All
9	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the PCM harness connectors. Measure the resistance between ground and the S/C Lamp Signal circuit. Is the resistance below 100.0 ohms?</p> <p>Yes → Repair the S/C Lamp Signal circuit for a short to ground. Perform SPEED CONTROL VERIFICATION - VER-4.</p> <p>No → Go To 10</p>	All
10	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the PCM harness connectors. Disconnect the ASD Relay from the PDC. Connect a jumper wire across ASD Relay connector cavities 30 and 87 (in the PDC). Turn the ignition on. Measure the voltage of the S/C Lamp Signal circuit. Is the voltage below 8.0 volts?</p> <p>Yes → Go To 11</p> <p>No → Repair the S/C Lamp Signal circuit for a short to voltage. Perform SPEED CONTROL VERIFICATION - VER-4.</p>	All
11	<p>Turn the ignition off. Disconnect the ECM harness connectors. Turn the ignition on. Connect a jumper wire between the S/C Lamp Signal circuit and ground. Observe the S/C Lamp. Is the S/C Lamp on?</p> <p>Yes → Replace and program the ECM in accordance with the Service Information. Perform SPEED CONTROL VERIFICATION - VER-4.</p> <p>No → Replace and program the PCM in accordance with the Service Information. Perform SPEED CONTROL VERIFICATION - VER-4.</p>	All

***CHECKING THE SPEED CONTROL OPERATION — Continued**

TEST	ACTION	APPLICABILITY
12	<p>Refer to any Technical Service Bulletins (TSB) that may apply to this condition. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Were any of the above conditions present?</p> <p>Yes → Repair as necessary Perform SPEED CONTROL VERIFICATION - VER-4.</p> <p>No → Go To 13</p>	All
13	<p>Check the brake lamp switch for proper adjustment. Is the brake lamp switch adjusted properly?</p> <p>Yes → Replace and program the Engine Control Module in accordance with the Service Information. Perform SPEED CONTROL VERIFICATION - VER-4.</p> <p>No → Adjust or replace the brake lamp switch as necessary. Perform SPEED CONTROL VERIFICATION - VER-4.</p>	All
14	<p>Turn the ignition off. Disconnect the Brake Lamp Switch harness connector. Turn the ignition on. Measure the voltage of the Secondary Brake Switch Signal circuit. Is the voltage above 9.0 volts?</p> <p>Yes → Go To 15</p> <p>No → Go To 17</p>	All
15	<p>Turn the ignition off. Disconnect the Brake Switch harness connector. With the DRB, monitor the brake switch input. Connect a jumper wire between the Brake Lamp Switch harness connector cavities 1 and 2. Did the DRB display change from Pressed to Released?</p> <p>Yes → Adjust or replace the Brake Lamp Switch. Perform SPEED CONTROL VERIFICATION - VER-4.</p> <p>No → Go To 16</p>	All
16	<p>Disconnect the Brake Lamp Switch harness connector. Measure the resistance between ground and the Brake Lamp Switch harness connector cavity 2. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace and program the ECM in accordance with the Service Information. Perform SPEED CONTROL VERIFICATION - VER-4.</p> <p>No → Repair the Ground circuit for an open. Perform SPEED CONTROL VERIFICATION - VER-4.</p>	All

*CHECKING THE SPEED CONTROL OPERATION — Continued

TEST	ACTION	APPLICABILITY
17	<p>Turn the ignition off. Disconnect the Brake Lamp Switch harness connector. Disconnect the ECM harness connectors. Measure the resistance of the Secondary Brake Switch Signal between the Brake Lamp Switch and the PCM. Is the resistance below 10.0 ohms?</p> <p>Yes → Go To 18</p> <p>No → Repair the Secondary Brake Switch Signal circuit for an open. Perform SPEED CONTROL VERIFICATION - VER-4.</p>	All
18	<p>Turn the ignition off. Disconnect the Brake Lamp Switch harness connector. Disconnect the ECM harness connectors. Measure the resistance between ground and the Secondary Brake Switch Signal circuit. Is the resistance below 100.0 ohms?</p> <p>Yes → Repair the Secondary Brake Switch Signal circuit for a short to ground. Perform SPEED CONTROL VERIFICATION - VER-4.</p> <p>No → Replace and program the ECM in accordance with the Service Information. Perform SPEED CONTROL VERIFICATION - VER-4.</p>	All
19	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the Brake Lamp Switch harness connector. Measure the resistance between ground and the Primary Brake Switch Sense circuit. Is the resistance below 100.0 ohms?</p> <p>Yes → Repair the Primary Brake Switch Signal circuit for a short to ground. Perform SPEED CONTROL VERIFICATION - VER-4.</p> <p>No → Go To 20</p>	All
20	<p>Turn the ignition off. Disconnect the ECM harness connectors. Disconnect the Brake Lamp Switch harness connector. Measure the resistance of the Primary Brake Switch Sense circuit. Is the resistance below 10.0 ohms?</p> <p>Yes → Go To 21</p> <p>No → Repair the Primary Brake Switch Signal circuit for an open. Perform SPEED CONTROL VERIFICATION - VER-4.</p>	All
21	<p>Disconnect the Brake Lamp Switch harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, check the Fused B+ circuit at the Brake Lamp Switch harness connector.. Does the test light illuminate brightly?</p> <p>Yes → Go To 22</p> <p>No → Repair the Fused B+ circuit for an open. Perform SPEED CONTROL VERIFICATION - VER-4.</p>	All

***CHECKING THE SPEED CONTROL OPERATION — Continued**

TEST	ACTION	APPLICABILITY
22	<p>NOTE: The Brake Switch must be properly adjusted before performing this test.</p> <p>Turn the ignition off. Disconnect the ECM harness connectors. Using a 12-volt test light connected to ground, probe the Primary Brake Switch Sense circuit at the ECM harness connector. While observing the test light, press and release the Brake Pedal several times. Does the test light turn on and off while pressing and releasing the Brake Pedal?</p> <p>Yes → Replace and program the ECM in accordance with the Service Information. Perform SPEED CONTROL VERIFICATION - VER-4.</p> <p>No → Replace the Brake Lamp Switch. Perform SPEED CONTROL VERIFICATION - VER-4.</p>	All
23	<p>Turn the ignition off. Disconnect the S/C Switch 4-way harness connector. Turn the ignition on. With the DRB, read the cruise switch voltage while connecting a jumper wire between the Sensor Ground circuit and the S/C Switch Signal circuit. Did the voltage change from approximately 5.0 volts to below 0.3 volts?</p> <p>Yes → Replace the S/C Switches. Perform SPEED CONTROL VERIFICATION - VER-4.</p> <p>No → Go To 24</p>	All
24	<p>Turn the ignition off. Disconnect the S/C Switch 4-way harness connector. Disconnect the ECM harness connector(s). Measure the resistance of the S/C Switch Signal circuit. Is the resistance below 10.0 ohms?</p> <p>Yes → Go To 25</p> <p>No → Repair the S/C Switch Signal circuit for an open. Perform SPEED CONTROL VERIFICATION - VER-4.</p>	All
25	<p>Turn the ignition off. Disconnect the S/C Switch 4-way harness connector. Disconnect the ECM harness connector(s). Measure the resistance of the S/C Sensor Ground circuit. Is the resistance below 10.0 ohms?</p> <p>Yes → Go To 26</p> <p>No → Repair the Sensor Ground circuit for an open. Perform SPEED CONTROL VERIFICATION - VER-4.</p>	All
26	<p>Turn the ignition off. Disconnect the S/C Switch 4-way harness connector. Disconnect the ECM harness connector(s). Measure the resistance between ground and the S/C Switch Signal circuit. Is the resistance below 100.0 ohms?</p> <p>Yes → Repair the S/C Switch Signal circuit for a short to ground. Perform SPEED CONTROL VERIFICATION - VER-4.</p> <p>No → Replace and program the ECM in accordance with the Service Information. Perform SPEED CONTROL VERIFICATION - VER-4.</p>	All

STARTING

Symptom:

*NO CRANK CONDITION

POSSIBLE CAUSES
BATTERY CABLE HIGH RESISTANCE
CHECKING SHIFTER LINKAGE
CLUTCH INTERLOCK SWITCH
CLUTCH INTERLOCK SWITCH SENSE CKT OPEN
INSPECT BATTERY CABLES
MECHANICAL PROBLEM
OPEN FUSED BATTERY (+) CIRCUIT
OPEN IGNITION SWITCH START OUTPUT
STARTER MOTOR
STARTER RELAY
STARTER RELAY OUTPUT CIRCUIT OPEN

TEST	ACTION	APPLICABILITY
1	<p>NOTE: The Clutch Pedal must be depressed during any engine start attempt.</p> <p>Turn the ignition off.</p> <p>NOTE: The battery must be fully charged before diagnosing a no crank condition.</p> <p>Inspect the battery cables for corrosion, looseness or other problems.</p> <p>Is there evidence of problems?</p> <p>Yes → Repair as necessary. Perform NO START VERIFICATION - VER-1.</p> <p>No → Go To 2</p>	All
2	<p>Remove the Starter Relay from the PDC.</p> <p>Using a 12-volt test light connected to ground, check the Fused B+ circuit.</p> <p>Is the test light on?</p> <p>Yes → Go To 3</p> <p>No → Repair the Fused B(+) circuit for an open. Perform NO START VERIFICATION - VER-1.</p>	All
3	<p>Remove the Starter Relay from the PDC.</p> <p>Using a 12-volt test light connected to ground, check the Ignition Switch Start Output circuit while turning the ignition switch to the crank position.</p> <p>Does the test light illuminate with the ignition switch in the crank position?</p> <p>Yes → Go To 4</p> <p>No → Repair the Ignition Switch Start Output circuit. Perform NO START VERIFICATION - VER-1.</p>	All

***NO CRANK CONDITION — Continued**

TEST	ACTION	APPLICABILITY
4	<p>WARNING: The transmission must be in Neutral and the parking break must be engaged for this test.</p> <p>WARNING: The engine may be cranked in this test. Keep away from moving engine parts.</p> <p>Briefly connect a jumper wire between the Starter Relay Output circuit and the Fused B+ circuit at the starter relay connector in the PDC.</p> <p>Did the engine crank?</p> <p>Yes → Go To 5</p> <p>No → Go To 8</p>	All
5	<p>Turn the ignition off.</p> <p>Remove the Starter Relay From the PDC.</p> <p>Install a substitute relay in place of the Starter Relay.</p> <p>Attempt to start the engine.</p> <p>Does the engine crank?</p> <p>Yes → Replace the Starter Relay.</p> <p>Perform NO START VERIFICATION - VER-1.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off.</p> <p>Disconnect the Clutch Interlock Switch harness connector.</p> <p>Connect a jumper wire between the Clutch Interlock Switch Sense circuit and ground.</p> <p>Attempt to start the engine.</p> <p>Does the engine crank?</p> <p>Yes → Repair the Clutch Interlock Switch Sense circuit for an open.</p> <p>Perform NO START VERIFICATION - VER-1.</p> <p>No → Go To 7</p>	All
7	<p>Check the shifter and associated linkage for proper adjustment between shifter and transmission.</p> <p>Were any problems found?</p> <p>Yes → Repair or replace as necessary.</p> <p>Perform NO START VERIFICATION - VER-1.</p> <p>No → Replace the Clutch Interlock Switch in accordance with the Service Information.</p> <p>Perform NO START VERIFICATION - VER-1.</p>	All
8	<p>Turn the ignition off.</p> <p>Remove the Starter Relay from the PDC.</p> <p>Disconnect the Starter Relay Output wire from the Starter Solenoid.</p> <p>Measure the resistance of the Starter Relay Output circuit between the PDC and the Starter Solenoid.</p> <p>Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 9</p> <p>No → Repair the Starter Relay Output circuit for an open.</p> <p>Perform NO START VERIFICATION - VER-1.</p>	All

*NO CRANK CONDITION — Continued

TEST	ACTION	APPLICABILITY
9	<p>Using the Service Information, check the battery cables for high resistance. Did either battery cable have a voltage drop greater than 0.2 volts?</p> <p>Yes → Replace the battery cable(s). Perform NO START VERIFICATION - VER-1.</p> <p>No → Go To 10</p>	All
10	<p>Turn the ignition off. Attempt to manually rotate the crankshaft 360°. Is the crankshaft able to rotate 360°?</p> <p>Yes → Replace the Starter Motor. Perform NO START VERIFICATION - VER-1.</p> <p>No → Repair the engine mechanical problem. Perform NO START VERIFICATION - VER-1.</p>	All

Symptom:***NO START CONDITION****POSSIBLE CAUSES**

CHECKING FUEL QUANTITY ACTUATOR
 ECM - IMMOBILIZER SIGNAL
 ECM - IMMOBILIZER SIGNAL OUTPUT
 FUEL INJECTION PUMP TIMING
 FUEL QUANTITY ACTUATOR CIRCUIT SHORT TO VOLTAGE
 FUEL SUPPLY CONTAMINATION
 FUEL SYSTEM PRESSURE
 FUEL SYSTEM RESTRICTION
 IMMOBILIZER SIGNAL CIRCUIT OPEN
 IMMOBILIZER SIGNAL CIRCUIT SHORTED TO GROUND
 IMMOBILIZER SIGNAL CIRCUIT SHORTED TO VOLTAGE
 VERIFYING IMMOBILIZER SIGNAL

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Check for SKIM, ECM, and PCM DTCs. Return to the Symptom List to diagnose any DTCs that are present before continuing.</p> <p>With the DRB, select Engine (JTEC), Miscellaneous and View SKIM Status. While observing the DRB, attempt to start the engine. Does the DRB display Fuel Shut-Off Activated?</p> <p>Yes → Go To 2</p> <p>No → Go To 7</p>	All
2	<p>Turn the ignition off. Disconnect the PCM harness connector. Disconnect the ECM harness connector. Remove the ASD Relay from the PDC. Connect a jumper wire between ASD Relay connector cavity 30 and cavity 87 in the PDC. Turn the ignition on. Measure the voltage of the Immobilizer Signal circuit. Is the voltage above 1.0 volt?</p> <p>Yes → Repair the Immobilizer Signal circuit for a short to voltage. Perform NO START VERIFICATION - VER-1.</p> <p>No → Go To 3</p>	All

*NO START CONDITION — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the PCM harness connector. Disconnect the ECM harness connector. Measure the resistance of the Immobilizer Signal circuit between the PCM harness connector and the ECM harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 4</p> <p>No → Repair the Immobilizer Signal circuit for an open. Perform NO START VERIFICATION - VER-1.</p>	All
4	<p>Turn the ignition off. Disconnect the PCM harness connector. Disconnect the ECM harness connector. Measure the resistance between ground and the Immobilizer Signal circuit at the PCM harness connector. Is the resistance above 100 kohms?</p> <p>Yes → Go To 5</p> <p>No → Repair the Immobilizer Signal circuit for a short to ground. Perform NO START VERIFICATION - VER-1.</p>	All
5	<p>Turn the ignition off. Disconnect the PCM harness connector. Turn the ignition on. Measure the amperage between PCM harness connector C-3 cavity 16 and ground. Is the amperage between 1.0 and 1.4 milliamperes?</p> <p>Yes → Go To 6</p> <p>No → Replace and program the ECM in accordance with the Service Information. Perform NO START VERIFICATION - VER-1.</p>	All
6	<p>With the DRBIII®, select the Lab Scope function. Set the voltage range to +20.0V Set the probe to X10. Set the time range to 0.1S/Div. Turn the ignition on. Using the oscilloscope lead, backprobe the PCM harness connector C3 cavity 16. NOTE: A valid immobilizer signal will cycle high and low similar to the pattern shown in Charts and Graphs. Does the DRB display show the 12-volt signal cycling high and low?</p> <p>Yes → Replace and program the ECM in accordance with the Service Information. Perform NO START VERIFICATION - VER-1.</p> <p>No → Replace the PCM in accordance with the Service Information. Perform NO START VERIFICATION - VER-1.</p>	All

***NO START CONDITION — Continued**

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Disconnect the Fuel Injection Pump 10-way harness connector. Measure the resistance between cavity 8 and cavity 9 of the Fuel Injection Pump 10-way harness connector. Is the resistance between 0.7 and 1.6 ohms? Yes → Go To 8 No → Replace the Fuel Injection Pump assembly. Perform NO START VERIFICATION - VER-1.	All
8	Turn the ignition off. Disconnect the ECM harness connector. Remove the ASD Relay from the PDC. Connect a jumper wire between ASD Relay connector cavity 30 and cavity 87 in the PDC. Turn the ignition on. Measure the voltage of the Fuel Quantity Actuator circuit at ECM harness connector C2 cavity 59. Is the voltage above 1.0 volt? Yes → Repair the Fuel Quantity Actuator circuit for a short to voltage. Perform NO START VERIFICATION - VER-1. No → Go To 9	All
9	Inspect and fuel system lines for restrictions, leaks or other problems. Is there any evidence of problems? Yes → Repair as necessary. Perform NO START VERIFICATION - VER-1. No → Go To 10	All
10	Refer to the Service Information and perform the fuel pressure test. Is the fuel pressure within specification? Yes → Go To 11 No → Check the Fuel Injection Pump drive. If the drive is working properly, replace the Fuel Injection Pump. Perform NO START VERIFICATION - VER-1.	All
11	Refer to the Service Information and check the Fuel Injection Pump Timing. Is the Fuel Injection Pump timing correct? Yes → Check the fuel supply for contamination. Perform NO START VERIFICATION - VER-1. No → Refer to the Service Information to correctly time the Fuel Injection Pump. Perform NO START VERIFICATION - VER-1.	All

Symptom List:

ANTENNA FAILURE
COP FAILURE
EEPROM FAILURE
INTERNAL FAULT
RAM FAILURE
SERIAL LINK INTERNAL FAULT
STACK OVERFLOW FAILURE

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be ANTENNA FAILURE.

When Monitored and Set Condition:

ANTENNA FAILURE

When Monitored: Every 250 milliseconds with the ignition on.

Set Condition: The SKIM's microcontroller determines that an antenna circuit fault has occurred for 2.0 consecutive seconds.

COP FAILURE

When Monitored: With the ignition on.

Set Condition: The COP timer is not reset by the microcontroller every 65.5 milliseconds

EEPROM FAILURE

When Monitored: With the ignition on.

Set Condition: When the value written to EEPROM memory does not equal the value read back after the write operation.

INTERNAL FAULT

When Monitored: With the ignition on.

Set Condition: The SKIM has detected a fault during an internal self test.

RAM FAILURE

When Monitored: With the ignition on.

Set Condition: The RAM fails a test that checks the RAM's ability to retain memory.

SERIAL LINK INTERNAL FAULT

When Monitored: With the ignition on.

Set Condition: The SKIM fails an internal J1850 communication self test.

STACK OVERFLOW FAILURE

When Monitored: With the ignition on.

Set Condition: The microcontroller has exceeded its stack space limit.

ANTENNA FAILURE — Continued

POSSIBLE CAUSES
SKIM INTERNAL DTC FAILURE

TEST	ACTION	APPLICABILITY
1	<p>Note: This trouble code indicates an internal SKIM fault.</p> <p>With the DRB III, read and record the SKIM DTC's and then erase the SKIM DTC's. Perform 10 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.</p> <p>With the DRB III, read the SKIM DTC's.</p> <p>Did the same SKIM DTC return?</p> <p>Yes → Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information.</p> <p>Perform SKIS VERIFICATION.</p> <p>No → Test Complete.</p>	All

Symptom List:

PCM STATUS FAILURE

SERIAL LINK EXTERNAL FAULT

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be PCM STATUS FAILURE.

When Monitored and Set Condition:

PCM STATUS FAILURE

When Monitored: With the ignition on.

Set Condition: This DTC exists when a PCM STATUS message was not received from the PCM for at least 20.0 consecutive seconds.

SERIAL LINK EXTERNAL FAULT

When Monitored: At ignition on, after ignition on during any rolling code handshake that occurs with the PCM due to a SKIM reset, or during SECRET KEY transfers to the PCM.

Set Condition: When the SKIM does not receive an expected PCI BUS message transmission acknowledgement from the PCM after 3 transmit attempts.

POSSIBLE CAUSES

INTERMITTENT WIRING HARNESS PROBLEM

WIRING HARNESS INSPECTION

SKIM/PCM

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure the PCM has proper power and ground connections before continuing.</p> <p>With the DRB III, read and record the SKIM DTC's then erase the SKIM DTC's. Turn the ignition off. Wait 2 minutes. Turn the ignition on. With the DRB III, read the SKIM DTC's. Does the DRB III display the DTC that was previously erased?</p> <p>Yes → Go To 2 No → Go To 4</p>	All

PCM STATUS FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	<p>Turn the ignition off.</p> <p>NOTE: Visually inspect the related wiring harness and CCD/PCI Bus (whichever applicable) circuits. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Note: Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Were any problems found?</p> <p>Yes → Repair as necessary. Perform SKIS VERIFICATION.</p> <p>No → Go To 3</p>	All
3	<p>NOTE: Before proceeding it will be necessary to obtain the SKIM PIN number.</p> <p>Turn the ignition on.</p> <p>With the DRB III, display and erase all PCM and SKIM DTC's.</p> <p>Perform 5 ignition key cycles leaving the ignition key on for a minimum of 90 seconds per cycle.</p> <p>With the DRB III, read the SKIM DTC's.</p> <p>Does the code appear?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform SKIS VERIFICATION.</p> <p>No → Test Complete.</p>	All
4	<p>Turn the ignition off.</p> <p>Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Note: Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Were any problems found?</p> <p>Yes → Repair wiring harness/connectors as necessary. Perform SKIS VERIFICATION.</p> <p>No → Test Complete.</p>	All

Symptom List:

ROLLING CODE FAILURE VIN MISMATCH

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be **ROLLING CODE FAILURE**.

When Monitored and Set Condition:

ROLLING CODE FAILURE

When Monitored: At ignition on, after ignition on during any rolling code handshake that occurs with the PCM due to a SKIM or PCM reset.

Set Condition: When a PCM STATUS message with a Valid Key status is not received by the SKIM within 3.5 seconds of transmitting the last Valid Key Code message to the PCM.

VIN MISMATCH

When Monitored: With the ignition on.

Set Condition: When the VIN received from the PCM does not match the VIN stored in the SKIM's EEPROM.

POSSIBLE CAUSES

VERIFYING PCM VIN
REPLACE SKIM AND CHECK DTC'S
INTERMITTENT WIRING HARNESS PROBLEM
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB III, erase the SKIM DTC's. Turn the ignition off. Wait 10 seconds. Turn the ignition on and wait 2 minutes. With the DRB III, read the SKIM DTC's. Does the DRB III display the DTC that was previously erased? Yes → Go To 2 No → Go To 4	All

ROLLING CODE FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	<p>NOTE: Ensure that a VIN has been programmed into the PCM. If a VIN is not displayed, attempt to program the PCM with the correct vehicle VIN before continuing.</p> <p>Turn the ignition on.</p> <p>With the DRB III, select Engine system from the main menu.</p> <p>Display and record the Vehicle Identification Number.</p> <p>Does the VIN recorded from the PCM match the VIN of the vehicle?</p> <p>Yes → Go To 3</p> <p>No → Replace and program the Powertrain Control Module in accordance with the Service Information.</p> <p>Perform SKIS VERIFICATION.</p>	All
3	<p>Turn the ignition off.</p> <p>Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information.</p> <p>Turn the ignition on.</p> <p>With the DRB III, display and erase all PCM and SKIM DTC's.</p> <p>Perform 5 ignition key cycles leaving the ignition on for 90 seconds per cycle.</p> <p>With the DRB III, check for SKIM DTC's.</p> <p>Does the DRB III display the same DTC?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information.</p> <p>Perform SKIS VERIFICATION.</p> <p>No → The repair is complete.</p> <p>Perform SKIS VERIFICATION.</p>	All
4	<p>Turn the ignition off.</p> <p>Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Note: Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Were any problems found?</p> <p>Yes → Repair wiring harness/connectors as necessary.</p> <p>Perform SKIS VERIFICATION.</p> <p>No → Test Complete.</p>	All

Symptom List:

TRANSPONDER COMMUNICATION FAILURE

TRANSPONDER CYCLIC REDUNDANCY CHECK (CRC) FAILURE

TRANSPONDER ID MISMATCH

TRANSPONDER RESPONSE MISMATCH

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be **TRANSPONDER COMMUNICATION FAILURE**.

When Monitored and Set Condition:

TRANSPONDER COMMUNICATION FAILURE

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When the SKIM does not receive a transponder response after 8 consecutive transponder read attempts within 2.0 seconds.

TRANSPONDER CYCLIC REDUNDANCY CHECK (CRC) FAILURE

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When 5 consecutive transponder signal transmissions are sent to the SKIM with the correct message format but with invalid data.

TRANSPONDER ID MISMATCH

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When the transponder ID read by the SKIM does not match any of the transponder ID's stored in the SKIM's memory.

TRANSPONDER RESPONSE MISMATCH

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When the transponder's crypto algorithm result fails to match the SKIM's result.

POSSIBLE CAUSES

CHECKING MULTIPLE KEY OPERATION

SKIM

INTERMITTENT WIRING HARNESS PROBLEM

REPLACE IGNITION KEY

TRANSPONDER COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
1	<p>With the DRB III, read and record the SKIM DTC's. With the DRB III, erase the SKIM DTC's. NOTE: Perform the following test several times to ensure the DTC is current. Turn the ignition off. Wait 10 seconds. Turn the ignition on. With the DRB III, read the SKIM DTC's. Does the DRB display the DTC that was previously erased?</p> <p>Yes → Go To 2 No → Go To 7</p>	All
2	<p>Are there multiple vehicle ignition keys available?</p> <p>Yes → Go To 3 No → Go To 4</p>	All
3	<p>NOTE: Perform the following steps using one of the vehicle ignition keys. When finished, repeat the procedure using each of the other vehicle keys one at a time. With the DRB III, erase the SKIM DTC's. Turn the ignition off. Wait 10 seconds. Turn the ignition on. With the DRB III, read the SKIM DTC's. Is the DTC present for all ignition keys.</p> <p>Yes → Replace the Sentry Key Immobilizer Module in accordance with the Service Information. Perform SKIS VERIFICATION. No → Test Complete.</p>	All
4	<p>With the DRB III, attempt to reprogram the ignition keys to the SKIM. With the DRB III, erase the SKIM DTC's. Wait 10 seconds. Turn the ignition on. With the DRB III, read the SKIM DTC's. Does the DTC reset?</p> <p>Yes → Go To 5 No → Test Complete.</p>	All
5	<p>Replace the ignition key with a new key. With the DRB III, program the new ignition key to the SKIM. With the DRB III, erase the SKIM DTC's Turn the ignition off. Wait 10 seconds. Turn the ignition on. With the DRB III, read the SKIM DTC's. Does the DTC reset?</p> <p>Yes → Go To 6 No → Test Complete.</p>	All

Verification Tests

CHARGING VERIFICATION - VER-3	APPLICABILITY
<ol style="list-style-type: none"> 1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. If the PCM has been replaced, perform step 3. Otherwise, continue with step 4. 3. If the vehicle is equipped with a factory theft alarm, start the engine at least 20 times in order to be able to activate the alarm system when desired. 4. With the DRB, erase all diagnostic trouble codes (DTCs). 5. Start the engine. 6. Raise the engine speed to 2000 RPM for at least 30 seconds. 7. Allow the engine to idle. 8. Turn the ignition off for 20 seconds. 9. Turn the ignition on. 10. With the DRB, read ECM and PCM DTCs. 11. If this DTC has reset, or another DTC has set, look for any Technical Service Bulletins (TSBs) that may relate to this condition. Return to the Symptom List if necessary. 12. If the charging system is functioning correctly and there are no DTCs, the repair is now complete. <p>Are any DTCs or symptoms remaining?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All

NO START VERIFICATION - VER-1	APPLICABILITY
<ol style="list-style-type: none"> 1. NOTE: IMPORTANT! If the Engine Control Module, Sentry Key Immobilizer Module or Powertrain Control Module have been replaced, ensure the programming procedures for these modules have been performed in accordance with the Service Information. 2. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 3. Inspect the engine oil for contamination. If it is contaminated, change the oil and filter. 4. With the DRB, erase all diagnostic trouble codes (DTCs). 5. Turn the ignition off for at least 10 seconds. 6. Attempt to start the engine. 7. If the engine is unable to start, look for any Technical Service Bulletins (TSBs) that may relate to this condition. Return to the Symptom List if necessary. 8. If the engine starts and continues to run, the repair is now complete. <p>Are any DTCs or symptoms remaining?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 1	APPLICABILITY
<ol style="list-style-type: none"> 1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. Inspect the engine oil for contamination. If it is contaminated, change the oil and filter. 3. Perform the steps 4 through 6 if the PCM has been replaced. Then proceed with the verification. If the PCM has not been replaced skip those steps and continue verification. 4. If PCM has been changed and correct VIN and mileage have not been programmed a DTC will be set in ABS and Air Bag modules. In addition, if vehicle is equipped with a Sentry Key Immobilizer Module (SKIM), Secret Key data must be updated to enable start. 5. For ABS and Air Bag systems: Enter correct VIN and Mileage in PCM. Erase codes in ABS and Air Bag modules. 6. For SKIM theft alarm: Connect DRBIII® to data link conn. Go to Theft Alarm, SKIM, Misc. and place SKIM in secured access mode, by using the appropriate PIN code for this vehicle. Select Update the Secret Key data. Data will be transferred from SKIM to PCM 7. Attempt to start the engine. 8. If the engine is unable to start, look for any Technical Service Bulletins that may relate to this condition. Return to Symptom List if necessary. 9. If the engine starts and stays running, the repair is now complete. 	All

ROAD TEST VERIFICATION - VER-2	APPLICABILITY
<ol style="list-style-type: none"> 1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. If this verification procedure is being performed after a non-DTC test, perform steps 3 and 4. 3. Check to see if the initial symptom still exists. If there are no trouble codes and the symptom no longer exists, the repair was successful and testing is now complete. 4. If the initial or another symptom exists, the repair is not complete. Check all pertinent Technical Service Bulletins (TSBs) and return to the Symptom List if necessary. 5. For previously read DTCs that have not been dealt with, return to the Symptom List and follow the diagnostic path for that DTC; otherwise, continue. 6. If the engine control module (ECM) has not been changed, perform steps 7 and 8, otherwise, continue with step 9. 7. With the DRB, erase all diagnostic trouble codes (DTCs), then disconnect the DRB. 8. Turn the ignition off for at least 10 seconds. 9. Ensure no DTCs remain by performing steps 10 through 13. 10. Road test the vehicle. For some of the road test, go at least 64 km/h (40 MPH). If this test is for an A/C Relay Control Circuit, drive the vehicle for at least 5 minutes with the A/C on. 11. At some point, stop the vehicle and turn the engine off for at least 10 seconds, then restart the engine and continue. 12. Upon completion of the road test, turn the engine off and check for DTCs with the DRB. 13. If the repaired DTC has reset, the repair is not complete. Check for any pertinent Technical Service Bulletins (TSBs) and return to the Symptom List. If there are no DTCs, the repair was successful and is now complete. <p>Are any DTCs or symptoms remaining?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All

Verification Tests — Continued

SKIS VERIFICATION	APPLICABILITY
<p>1. Reconnect all previously disconnected components and connectors.</p> <p>2. Obtain the vehicle's unique Personal Identification Number (PIN) assigned to it's original SKIM. This number can be obtained from the vehicle's invoice or Chrysler's Customer Center (1-800-992-1997).</p> <p>3. NOTE: When entering the PIN, care should be taken because the SKIM will only allow 3 consecutive attempts to enter the correct PIN. If 3 consecutive incorrect PIN's are entered the SKIM will Lock Out the DRB III for 1 hour.</p> <p>4. To exit Lock Out mode, the ignition key must remain in the Run position continually for 1 hour. Turn off all accessories and connect a battery charger if necessary.</p> <p>5. With the DRB III, select Theft Alarm, SKIM and Miscellaneous. Then select desired procedure and follow the steps that will be displayed.</p> <p>6. If the SKIM has been replaced, ensure all of the vehicle ignition keys are programmed to the new SKIM.</p> <p>7. NOTE: Prior to returning vehicle to the costumer, perform a module scan to be sure that all DTC's are erased. Erase any DTC's that are found.</p> <p>8. With the DRB III erase all DTC's. Perform 5 ignition key cycles leaving the key on for at least 90 seconds per cycle.</p> <p>9. With the DRB III, read the SKIM DTC's.</p> <p>Are there any SKIM DTC's?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All

Verification Tests — Continued

SPEED CONTROL VERIFICATION - VER-4	APPLICABILITY
<ol style="list-style-type: none"> 1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. If the PCM has been replaced, perform step 3. Otherwise, continue with step 4. 3. If the vehicle is equipped with a factory theft alarm, start the engine at least 20 times in order to be able to activate the alarm system when desired. 4. With the DRB, erase all diagnostic trouble codes (DTCs). 5. Road test the vehicle at a speed above 58 km/h (35 MPH). 6. Turn the speed control ON/OFF switch on. 7. Depress and release the SET switch. If the speed control does not engage, the repair is not complete, continue with step 15. 8. Quickly depress and release the RESUME/ACCEL switch. If the vehicle speed does not increase by 3 km/h (2 MPH), the repair is not complete, continue with step 15. 9. Using caution, depress and release the brake pedal. If the speed control does not disengage, the repair is not complete, continue with step 15. 10. With the vehicle speed at least 56 km/h (35 MPH), depress the RESUME/ACCEL switch. If the speed control does not resume at the previously set speed, the repair is not complete, continue with step 15. 11. Hold down the COAST switch. If the vehicle does not decelerate, the repair is not complete, continue with step 15. 12. While still holding down the COAST switch, ensure the vehicle speed is at least 56 km/h (35 MPH) and release the COAST switch. If the vehicle does not adjust and set a new vehicle speed, the repair is not complete, continue with step 15. 13. With the speed control engaged, depress the ON/OFF switch. If the speed control does not disengage, the repair is not complete, continue with step 15. 14. If the vehicle did not successfully perform all of the previous steps, check for Technical Service Bulletins (TSBs) that pertain to this speed control problem and then, if necessary, return to the Symptom List. 15. If the vehicle successfully performed all of the previous steps, the speed control system is now functioning as designed. The repair is now complete. <p>Are any DTCs or symptoms remaining?</p> <p style="margin-left: 40px;">Yes → Repair is not complete, refer to appropriate symptom.</p> <p style="margin-left: 40px;">No → Repair is complete.</p>	All

VEHICLE IDENTIFICATION NUMBER

DESCRIPTION

The Vehicle Identification Number (VIN) plate is located on the lower windshield fence near the left A-pillar. The VIN contains 17 characters that provide data concerning the vehicle. Refer to the VIN decoding chart to determine the identification of a vehicle.

The Vehicle Identification Number is also imprinted on the:

- Body Code Plate.
- Vehicle Safety Certification Label.
- Frame rail.

To protect the consumer from theft and possible fraud the manufacturer is required to include a Check Digit at the ninth position of the Vehicle Identification Number. The check digit is used by the manufacturer and government agencies to verify the authenticity of the vehicle and official documentation. The formula to use the check digit is not released to the general public.

E-MARK LABEL

DESCRIPTION

An E-mark Label (Fig. 1) is located on the rear shut face of the driver's door. The label contains the following information:

- Date of Manufacture
- Month-Day-Hour (MDH)
- Vehicle Identification Number (VIN)
- Country Codes
- Regulation Number
- Regulation Amendment Number
- Approval Number

LUBRICATION & MAINTENANCE

DESCRIPTION - FUEL REQUIREMENTS

Your engine is designed to meet all emissions regulations and provide excellent fuel economy and performance when using high quality unleaded “regular” gasoline having an octane rating of 87. The routine use of premium gasoline is not recommended. Under normal conditions the use of premium fuel will not provide a benefit over high quality regular gasolines and in some circumstances may result in poorer performance.

Light spark knock at low engine speeds is not harmful to your engine. However, continued heavy spark knock at high speeds can cause damage and immediate service is required. Engine damage resulting from operation with a heavy spark knock may not be covered by the new vehicle warranty.

Poor quality gasoline can cause problems such as hard starting, stalling and hesitations. If you experience these symptoms, try another brand of gasoline before considering service for the vehicle.

Over 40 auto manufacturers world-wide have issued and endorsed consistent gasoline specifications (the Worldwide Fuel Charter, WWFC) to define fuel properties necessary to deliver enhanced emissions, performance and durability for your vehicle. We recommend the use of gasolines that meet the WWFC specifications if they are available.

REFORMULATED GASOLINE

Many areas of the country require the use of cleaner burning gasoline referred to as “reformulated” gasoline. Reformulated gasoline contain oxygenates, and are specifically blended to reduce vehicle emissions and improve air quality.

We strongly support the use of reformulated gasoline. Properly blended reformulated gasoline will provide excellent performance and durability for the engine and fuel system components.

GASOLINE/OXYGENATE BLENDS

Some fuel suppliers blend unleaded gasoline with oxygenates such as 10% ethanol, MTBE, and ETBE. Oxygenates are required in some areas of the country during the winter months to reduce carbon monoxide emissions. Fuels blended with these oxygenates may be used in your vehicle.

CAUTION: DO NOT use gasoline containing METHANOL. Gasoline containing methanol may damage critical fuel system components.

MMT IN GASOLINE

MMT is a manganese-containing metallic additive that is blended into some gasoline to increase octane. Gasoline blended with MMT provide no performance advantage beyond gasoline of the same octane number without MMT. Gasoline blended with MMT reduce spark plug life and reduce emission system performance in some vehicles. We recommend that gasolines free of MMT be used in your vehicle. The MMT content of gasoline may not be indicated on the gasoline pump; therefore, you should ask your gasoline retailer whether or not his/her gasoline contains MMT.

It is even more important to look for gasoline without MMT in Canada because MMT can be used at levels higher than allowed in the United States. MMT is prohibited in Federal and California reformulated gasoline.

SULFUR IN GASOLINE

If you live in the northeast United States, your vehicle may have been designed to meet California low emission standards with Cleaner-Burning California reformulated gasoline with low sulfur. If such fuels are not available in states adopting California emission standards, your vehicles will operate satisfactorily on fuels meeting federal specifications, but emission control system performance may be adversely affected. Gasoline sold outside of California is permitted to have higher sulfur levels which may

LUBRICATION & MAINTENANCE (Continued)

affect the performance of the vehicle's catalytic converter. This may cause the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light to illuminate. We recommend that you try a different brand of unleaded gasoline having lower sulfur to determine if the problem is fuel related prior to returning your vehicle to an authorized dealer for service.

CAUTION: If the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light is flashing, immediate service is required; see on-board diagnostics system section.

MATERIALS ADDED TO FUEL

All gasoline sold in the United States and Canada are required to contain effective detergent additives. Use of additional detergents or other additives is not needed under normal conditions.

FUEL SYSTEM CAUTIONS

CAUTION: Follow these guidelines to maintain your vehicle's performance:

- The use of leaded gas is prohibited by Federal law. Using leaded gasoline can impair engine performance, damage the emission control system, and could result in loss of warranty coverage.
- An out-of-tune engine, or certain fuel or ignition malfunctions, can cause the catalytic converter to overheat. If you notice a pungent burning odor or some light smoke, your engine may be out of tune or malfunctioning and may require immediate service. Contact your dealer for service assistance.
- When pulling a heavy load or driving a fully loaded vehicle when the humidity is low and the temperature is high, use a premium unleaded fuel to help prevent spark knock. If spark knock persists, lighten the load, or engine piston damage may result.
- The use of fuel additives which are now being sold as octane enhancers is not recommended. Most of these products contain high concentrations of methanol. Fuel system damage or vehicle performance problems resulting from the use of such fuels or additives is not the responsibility of DaimlerChrysler Corporation and may not be covered under the new vehicle warranty.

NOTE: Intentional tampering with emissions control systems can result in civil penalties being assessed against you.

8 1/4	2.08L (4.4 pts.)**
* When equipped with Trac-lok, include 3.5 ounces of Friction Modifier.	
** When equipped with Trac-lok, include 4 ounces of Friction Modifier.	
*** Includes 0.9L (1.0 qts.) for coolant reservoir.	
****Nominal refill capacities are shown. A variation may be observed from vehicle to vehicle due to manufacturing tolerance and refill procedure.	

FLUID TYPES**DESCRIPTION - TRANSFER CASE - NV231**

Recommended lubricant for the NV231 transfer case is Mopar® ATF +4, type 9602, Automatic Transmission Fluid.

DESCRIPTION - TRANSFER CASE - NV242

Recommended lubricant for the NV242 transfer case is Mopar® ATF+4, type 9602 Automatic Transmission Fluid.

DESCRIPTION - GEAR LUBRICATION RECOMMENDATIONS

A multi-purpose, hypoid gear lubricant which conforms to the following specifications should be used.

FLUID TYPES (Continued)

Mopar Hypoid Gear Lubricant conforms to all of these specifications.

FRONT AXLE

- The lubricant should have MIL-L-2105C and API GL 5 quality specifications.
- Lubricant is a thermally stable SAE 80W-90 gear lubricant.
- Lubricant for axles intended for heavy-duty or trailer tow use is SAE 75W-140 SYNTHETIC gear lubricant.

REAR AXLE

- The lubricant should have MIL-L-2105C and API GL 5 quality specifications.
- Lubricant is a thermally stable SAE 80W-90 gear lubricant.
- Lubricant for axles intended for heavy-duty or trailer tow use is SAE 75W-140 SYNTHETIC gear lubricant.

NOTE: Trac-lok™ equipped axles require a friction modifier be added to the lubricant.

CAUTION: If axle is submerged in water, lubricant must be replaced immediately to avoid possible premature axle failure.

DESCRIPTION - AUTOMATIC TRANSMISSION FLUID

NOTE: Refer to the maintenance schedules in this group for the recommended maintenance (fluid/filter change) intervals for this transmission.

NOTE: Refer to Service Procedures in this group for fluid level checking procedures.

Mopar® Dexron III/Mercon is the recommended fluid for the AW-4 automatic transmissions.

Dexron II fluid IS NOT recommended. Clutch chatter can result from the use of improper fluid.

Mopar® Dexron III/Mercon automatic transmission fluid when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** A dark brown/black fluid accompanied with a burnt odor and/or deterioration in shift quality may indicate fluid deterioration or transmission component failure.

FLUID ADDITIVES

DaimlerChrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various “special” additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of DaimlerChrysler and these additives **must not be used**. The use of transmission “sealers” should also be avoided, since they may adversely affect the integrity of transmission seals.

DESCRIPTION - ENGINE OIL

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

API SERVICE GRADE CERTIFIED

Use an engine oil that is API Service Grade Certified. MOPAR® provides engine oils that conform to this service grade.

SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-30 or 10W-30. These oils are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Select an engine oil that is best suited to your particular temperature range and variation (Fig. 1).

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

FLUID TYPES (Continued)

*Fig. 1 Temperature/Engine Oil Viscosity*

CONTAINER IDENTIFICATION

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the label of engine oil plastic bottles and the top of engine oil cans (Fig. 2).

*Fig. 2 API Symbol*

9400-9

FLUID FILL/CHECK LOCATIONS

DESCRIPTION

The lubricant for the NV3550 is Mopar® Manual Transmission Lubricant. This is the **only** lubricant to be used, no other lubricants are acceptable, or recommended.

The correct transmission lubricant level is to the bottom edge of the fill plug hole (Fig. 3).

The transmission must be level to obtain an accurate lubricant level check. A drive-on type of hoist is recommended for this purpose.

The lubricant capacity is approximately 3.15 liters (3.3 qts). This is the approximate quantity needed to refill the transmission after a lubricant change or overhaul.

The fill plug is located in the front housing and the drain plug is on the bottom of the housing (Fig. 3).

DESCRIPTION - TRANSFER CASE

The fill and drain plugs are both in the rear case (Fig. 4). Correct fill level is to the bottom edge of the fill plug hole. Be sure the vehicle is level to ensure an accurate fluid level check.

FLUID FILL/CHECK LOCATIONS (Continued)

FLUID FILL LOCATIONS AND LUBRICATION POINTS

The fluid fill/check locations and lubrication points are located in each applicable group.

MAINTENANCE SCHEDULES

DESCRIPTION

There are two maintenance schedules that show proper service based on the conditions that the vehicle is subjected to.

Schedule "A", lists scheduled maintenance to be performed when the vehicle is used for general transportation.

Schedule "B", lists maintenance intervals for vehicles that are operated under the conditions listed at the beginning of that schedule section.

Use the schedule that best describes the driving conditions.

Where time and mileage are listed, follow the interval that occurs first.

UNSCHEDULED INSPECTION

At Each Stop For Fuel

- Check engine oil level, add as required.
- Check windshield washer solvent and add if required.

Once A Month

- Check tire pressure and look for unusual wear or damage.
- Inspect battery and clean and tighten terminals as required. Check electrolyte level and add water as needed.
- Check fluid levels of coolant reservoir, power steering, brake master cylinder, and transmission and add as needed.
- Check all lights and all other electrical items for correct operation.

At Each Oil Change

- Inspect exhaust system.
- Inspect brake hoses.
- Rotate the tires at each oil change interval shown on Schedule "A" (7,500 miles) or every other interval shown on Schedule "B" (6,000 miles).
- Check coolant level, hoses, and clamps.
- After completion of off-road operation, the underside of the vehicle should be thoroughly inspected. Examine threaded fasteners for looseness.

EMISSION CONTROL SYSTEM MAINTENANCE

The scheduled emission maintenance listed in **bold type** on the Maintenance Schedules, must be done at

the mileage specified to assure the continued proper functioning of the emission control system. These, and all other maintenance services included in this manual, should be done to provide the best vehicle performance and reliability. More frequent maintenance may be needed for vehicles in severe operating conditions such as dusty areas and very short trip driving.

FLUID FILL LOCATIONS AND LUBRICATION POINTS

The fluid fill/check locations and lubrication points are located in each applicable group.

SCHEDULE—A

1 000 KM

- Change engine oil.
- Change engine oil filter.
- Check all fluid levels.
- Check correct torque, intake manifold mounting nuts.
- Check correct torque, exhaust manifold mounting nuts.
- Check correct torque, turbocharger mounting nuts.
- Check correct torque, water manifold bolts.

10 000 KM

- Change engine oil.
- Change engine oil filter.

20 000 KM

- Change engine oil.
- Change engine oil filter.
- Replace air filter element.
- Drive belt visual inspection.

30 000 KM

- Change engine oil.
- Change engine oil filter.

40 000 KM

- Change engine oil.
- Change engine oil filter.
- Replace air filter element.
- Drive belt visual inspection.
- Replace fuel filter/water separator element.**

50 000 KM

- Change engine oil.
- Change engine oil filter.
- Drain and fill transfer case fluid.

60 000 KM

- Change engine oil.
- Change engine oil filter.

MAINTENANCE SCHEDULES (Continued)

- Replace air filter element.
- Replace drive belt.
- Check engine smoke.
- Replace engine coolant.

70 000 KM

- Change engine oil.
- Change engine oil filter.

80 000 KM

- Change engine oil.
- Change engine oil filter.
- Replace air filter element.
- Drive belt visual inspection.
- Replace fuel filter/water separator element.**

90 000 KM

- Change engine oil.
- Change engine oil filter.

100 000 KM

- Change engine oil.
- Change engine oil filter.
- Replace air filter element.
- Drive belt visual inspection.
- Check glow plug operation.
- Drain and fill transfer case fluid.

EVERY 40 000 KM AFTER 80 000 KM

- Replace fuel filter/water separator element.**

**The fuel filter/water separator element should be replaced once a year if the vehicle is driven less than 40 000 km annually or if power loss from fuel starvation is detected.

EVERY 10 000 KM AFTER 100 000 KM

- Change engine oil.
- Change engine oil filter.

EVERY 20 000 KM AFTER 100 000 KM

- Change engine oil.
- Change engine oil filter.
- Replace air filter element.
- Drive belt visual inspection.
- Check glow plug operation.

Important: Inspection and service should also be performed any time a malfunction is observed or suspected.

SCHEDULE "B"

Follow Schedule "B" if the vehicle is usually operated under one or more of the following conditions.

- Frequent short trips driving less than 5 miles (8 km).
- Frequent driving in dusty conditions.
- Frequent trailer towing.
- Extensive idling.

- More than 50% of driving is at sustained high speeds during hot weather, above 90°F (32°C).

- Off-road driving.
- Desert operation.

500 KM

- Check correct torque, intake manifold mounting nuts.
- Check correct torque, exhaust manifold mounting nuts.
- Check correct torque, turbocharger mounting nuts.
- Check correct torque, water manifold bolts.

1 000 KM

- Change engine oil.
- Change engine oil filter.
- Check all fluid levels.

5 000 KM

- Change engine oil.
- Change engine oil filter.

10 000 KM

- Change engine oil.
- Change engine oil filter.
- Replace air filter element.
- Drive belt visual inspection.

15 000 KM

- Change engine oil.
- Change engine oil filter.

20 000 KM

- Change engine oil.
- Change engine oil filter.
- Replace air filter element.
- Drive belt visual inspection.

25 000 KM

- Change engine oil.
- Change engine oil filter.

30 000 KM

- Change engine oil.
- Change engine oil filter.
- Replace air filter element.
- Replace drive belt.
- Check engine smoke.
- Replace engine coolant.

35 000 KM

- Change engine oil.
- Change engine oil filter.

MAINTENANCE SCHEDULES (Continued)

40 000 KM

- Change engine oil.
- Change engine oil filter.
- Replace air filter element.
- Drive belt visual inspection.
- Replace fuel filter/water separator element.

45 000 KM

- Change engine oil.
- Change engine oil filter.

50 000 KM

- Change engine oil.
- Change engine oil filter.
- Replace air filter element.
- Drive belt visual inspection.
- Drain and fill transfer case fluid.

55 000 KM

- Change engine oil.
- Change engine oil filter.

60 000 KM

- Change engine oil.
- Change engine oil filter.
- Replace air filter element.
- Drive belt visual inspection.
- Replace fuel filter/water separator element.

65 000 KM

- Change engine oil.
- Change engine oil filter.

70 000 KM

- Change engine oil.
- Change engine oil filter.
- Replace air filter element.
- Drive belt visual inspection.

75 000 KM

- Change engine oil.
- Change engine oil filter.

80 000 KM

- Change engine oil.
- Change engine oil filter.
- Replace air filter element.
- Replace drive belt.
- Check engine smoke.
- Replace engine coolant.

85 000 KM

- Change engine oil.
- Change engine oil filter.

90 000 KM

- Change engine oil.
- Change engine oil filter.
- Replace air filter element.
- Drive belt visual inspection.

95 000 KM

- Change engine oil.
- Change engine oil filter.

100 000 KM

- Change engine oil.
- Change engine oil filter.
- Replace air filter element.
- Drive belt visual inspection.
- Check glow plug operation.
- Replace fuel filter/water separator element.
- Drain and fill transfer case fluid.

EVERY 5 000 KM AFTER 100 000 KM

- Change engine oil.
- Change engine oil filter.

EVERY 10 000 KM AFTER 100 000 KM

- Change engine oil.
- Change engine oil filter.
- Replace air filter element.
- Drive belt visual inspection.
- Check glow plug operation.

EVERY 20 000 KM AFTER 100 000 KM

• Replace fuel filter/water separator element.
‡Off-highway operation, trailer towing, taxi, limousine, bus, snow plowing, or other types of commercial service or prolonged operation with heavy loading, especially in hot weather, require front and rear axle service indicated with a ‡ in Schedule "B". Perform these services if the vehicle is usually operated under these conditions.

Important: Inspection and service should also be performed any time a malfunction is observed or suspected.

UNSCHEDULED INSPECTION**At Each Stop For Fuel**

- Check engine oil level, add as required.

Once A Month

- Check tire pressure and look for unusual wear or damage.
- Inspect battery and clean and tighten terminals as required. Check electrolyte level and add water as needed.

MAINTENANCE SCHEDULES (Continued)

- Check fluid levels of coolant reservoir, power steering, brake master cylinder, and transmission and add as needed.
- Check all lights and all other electrical items for correct operation.

At Each Oil Change

- Inspect exhaust system.
- Inspect brake hoses.
- Rotate the tires at each oil change interval shown on Schedule "A" (7,500 miles) or every other interval shown on Schedule "B" (6,000 miles).
- Check coolant level, hoses, and clamps.
- After completion of off-road operation, the underside of the vehicle should be thoroughly inspected. Examine threaded fasteners for looseness.

EMISSION CONTROL SYSTEM MAINTENANCE

The scheduled emission maintenance listed in **bold type** on the Maintenance Schedules, must be done at the mileage specified to assure the continued proper functioning of the emission control system. These, and all other maintenance services included in this manual, should be done to provide the best vehicle performance and reliability. More frequent maintenance may be needed for vehicles in severe operating conditions such as dusty areas and very short trip driving.

FLUID FILL LOCATIONS AND LUBRICATION POINTS

The fluid fill/check locations and lubrication points are located in each applicable group.

SCHEDULE "A"**7,500 Miles (12 000 km) or at 6 months**

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage (4x4 only).
- Check manual transmission fluid level.
- Check exhaust system.

15,000 Miles (24 000 km) or at 12 months

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate ball joints.
- Lubricate steering linkage (4x4 and 4x2).
- Check manual transmission fluid level.
- Check exhaust system.

22,500 Miles (36 000 km) or at 18 months

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Inspect brake linings.
- Lubricate steering linkage (4x4 only).
- Check manual transmission fluid level.
- Check exhaust system.

30,000 Miles (48 000 km) or at 24 months

- **Replace air cleaner element.**
- **Replace spark plugs.**
- Inspect drive belt, adjust tension as necessary.
- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate ball joints.
- Lubricate steering linkage (4x4 and 4x2).
- Drain and refill automatic transmission fluid.
- Check manual transmission fluid level.
- Drain and refill transfer case fluid.
- Check exhaust system.

37,500 Miles (60 000 km) or at 30 months

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage (4x4 only).
- Check manual transmission fluid level.
- Check exhaust system.

45,000 Miles (72 000 km) or at 36 months

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Inspect brake linings.
- Lubricate ball joints.
- Lubricate steering linkage (4x4 and 4x2).
- Check manual transmission fluid level.
- Check exhaust system.

52,500 Miles (84 000 km) or at 42 months

- Check engine coolant level, hoses, and clamps.
- Flush and replace engine coolant. Then flush and replace every 24 months or 30,000 miles (48 000 km).
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage (4x4 only).
- Check manual transmission fluid level.
- Check exhaust system.

MAINTENANCE SCHEDULES (Continued)

60,000 Miles (96 000 km) or at 48 months

- **Replace air cleaner element.**
- **Replace ignition cables.**
- **Replace spark plugs.**
- Inspect drive belt, adjust tension as necessary.
- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate ball joints.
- Lubricate steering linkage (4x4 and 4x2).
- Drain and refill automatic transmission fluid.
- Check manual transmission fluid level.
- Drain and refill transfer case fluid.
- Check exhaust system.

67,500 Miles (108 000 km) or at 54 months

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Inspect brake linings.
- Lubricate steering linkage (4x4 only).
- Check manual transmission fluid level.
- Check exhaust system.

75,000 Miles (120 000 km) or at 60 months

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate ball joints.
- Lubricate steering linkage (4x4 and 4x2).
- Check manual transmission fluid level.
- Check exhaust system.

82,500 Miles (133 000 km) or at 66 months

- Check engine coolant level, hoses, and clamps.
- Flush and replace engine coolant.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage (4x4 only).
- Check manual transmission fluid level.
- Check exhaust system.

90,000 Miles (144 000 km) or at 72 months

- **Replace air cleaner element.**
- **Replace spark plugs.**
- Inspect drive belt, adjust tension as necessary.
- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Inspect brake linings.
- Lubricate ball joints.

- Lubricate steering linkage (4x4 and 4x2).
- Drain and refill automatic transmission fluid.
- Check manual transmission fluid level.
- Drain and refill transfer case fluid.
- Check exhaust system.

97,500 Miles (156 000 km) or at 78 months

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage (4x4 only).
- Check manual transmission fluid level.
- Check exhaust system.

105,000 Miles (168 000 km) or at 84 months

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate ball joints.
- Lubricate steering linkage (4x4 and 4x2).
- Check manual transmission fluid level.
- Check exhaust system.

112,500 Miles (180 000 km) or at 90 months

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Inspect brake linings.
- Lubricate steering linkage (4x4 only).
- Check manual transmission fluid level.
- Check exhaust system.

120,000 Miles (192 000 km) or at 96 months

- **Replace air cleaner element.**
- **Replace ignition cables.**
- **Replace spark plugs.**
- Inspect drive belt, adjust tension as necessary.
- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate ball joints.
- Lubricate steering linkage (4x4 and 4x2).
- Drain and refill automatic transmission fluid.
- Check manual transmission fluid level.
- Drain and refill transfer case fluid.
- Check exhaust system.

Important: Inspection and service should also be performed any time a malfunction is observed or suspected.

SCHEDULE "B"

Follow Schedule "B" if the vehicle is usually operated under one or more of the following conditions.

MAINTENANCE SCHEDULES (Continued)

- Frequent short trips driving less than 5 miles (8 km).
- Frequent driving in dusty conditions.
- Frequent trailer towing.
- Extensive idling.
- More than 50% of driving is at sustained high speeds during hot weather, above 90°F (32°C).
- Off-road driving.
- Desert operation.

3,000 Miles (5 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

6,000 Miles (10 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate ball joints.
- Lubricate steering linkage.
- Check manual transmission fluid level.
- Check exhaust system.

9,000 Miles (14 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

12,000 Miles (19 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Inspect brake linings.
- Lubricate ball joints.
- Lubricate steering linkage.
- Drain and refill automatic transmission fluid.
- Check manual transmission fluid level.
- Change front and rear axle fluid.
- Check exhaust system.

15,000 Miles (24 000 km)

- **Inspect engine air cleaner element, replace as necessary.**
- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.

- Check exhaust system.

18,000 Miles (29 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate ball joints.
- Lubricate steering linkage.
- Check manual transmission fluid level.
- Check exhaust system.

21,000 Miles (34 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

24,000 Miles (38 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Inspect brake linings.
- Lubricate ball joints.
- Lubricate steering linkage.
- Drain and refill automatic transmission fluid.
- Check manual transmission fluid level.
- Change front and rear axle fluid.
- Check exhaust system.

27,000 Miles (43 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

30,000 Miles (48 000 km)

- **Inspect engine air cleaner element, replace as necessary.**
- **Replace spark plugs.**
- Inspect drive belt, adjust tension as necessary.
- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate ball joints.
- Lubricate steering linkage.
- Check manual transmission fluid level.
- Drain and refill transfer case fluid.
- Check exhaust system.

MAINTENANCE SCHEDULES (Continued)

33,000 Miles (53 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

36,000 Miles (58 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Inspect brake linings.
- Lubricate ball joints.
- Lubricate steering linkage.
- Drain and refill automatic transmission fluid.
- Check manual transmission fluid level.
- Change front and rear axle fluid.
- Check exhaust system.

39,000 Miles (62 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

42,000 Miles (67 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate ball joints.
- Lubricate steering linkage.
- Check manual transmission fluid level.
- Check exhaust system.

45,000 Miles (72 000 km)

- **Inspect engine air cleaner element, replace as necessary.**
- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

48,000 Miles (77 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Inspect brake linings.
- Lubricate ball joints.

- Lubricate steering linkage.
- Drain and refill automatic transmission fluid.
- Check manual transmission fluid level.
- Change front and rear axle fluid.
- Check exhaust system.

51,000 Miles (82 000 km)

- Check engine coolant level, hoses, and clamps.
- Flush and replace engine coolant. Then flush and replace every 30,000 miles (48 000 km).
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

54,000 Miles (86 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate ball joints.
- Lubricate steering linkage.
- Check manual transmission fluid level.
- Check exhaust system.

57,000 Miles (91 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

60,000 Miles (96 000 km)

- **Inspect engine air cleaner element, replace as necessary. Replace ignition cables.**
- **Replace spark plugs.**
- Inspect drive belt, adjust tension as necessary.
- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Inspect brake linings.
- Lubricate ball joints.
- Lubricate steering linkage.
- Drain and refill automatic transmission fluid.
- Check manual transmission fluid level.
- Drain and refill transfer case fluid.
- Change front and rear axle fluid.
- Check exhaust system.

63,000 Miles (101 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.

MAINTENANCE SCHEDULES (Continued)

- Lubricate steering linkage.
- Check exhaust system.

66,000 Miles (106 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate ball joints.
- Lubricate steering linkage.
- Check manual transmission fluid level.
- Check exhaust system.

69,000 Miles (110 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

72,000 Miles (115 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Inspect brake linings.
- Lubricate ball joints.
- Lubricate steering linkage.
- Drain and refill automatic transmission fluid.
- Check manual transmission fluid level.
- Change front and rear axle fluid.
- Check exhaust system.

75,000 Miles (120 000 km)

- **Inspect engine air cleaner element, replace as necessary.**
- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

78,000 Miles (125 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate ball joints.
- Lubricate steering linkage.
- Check manual transmission fluid level.
- Check exhaust system.

81,000 Miles (130 000 km)

- Check engine coolant level, hoses, and clamps.
- Flush and replace engine coolant.

- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

84,000 Miles (134 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Inspect brake linings.
- Lubricate ball joints.
- Lubricate steering linkage.
- Drain and refill automatic transmission fluid.
- Check manual transmission fluid level.
- Change front and rear axle fluid.
- Check exhaust system.

87,000 Miles (139 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

90,000 Miles (144 000 km)

- **Inspect engine air cleaner element, replace as necessary.**
- **Replace spark plugs.**
- Inspect drive belt, adjust tension as necessary.
- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate ball joints.
- Lubricate steering linkage.
- Check manual transmission fluid level.
- Drain and refill transfer case fluid.
- Check exhaust system.

93,000 Miles (149 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

96,000 Miles (154 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Inspect brake linings.
- Lubricate ball joints.

MAINTENANCE SCHEDULES (Continued)

- Lubricate steering linkage.
- Drain and refill automatic transmission fluid.
- Check manual transmission fluid level.
- Change front and rear axle fluid.
- Check exhaust system.

99,000 Miles (158 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

102,000 Miles (163 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate ball joints.
- Lubricate steering linkage.
- Check manual transmission fluid level.
- Check exhaust system.

105,000 Miles (168 000 km)

- **Inspect engine air cleaner element, replace as necessary.**
- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

108,000 Miles (173 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Inspect brake linings.
- Lubricate ball joints.
- Lubricate steering linkage.
- Drain and refill automatic transmission fluid.
- Check manual transmission fluid level.
- Change front and rear axle fluid.
- Check exhaust system.

111,000 Miles (178 000 km)

- Check engine coolant level, hoses, and clamps.
- Flush and replace engine coolant.

- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

114,000 Miles (182 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate ball joints.
- Lubricate steering linkage.
- Check manual transmission fluid level.
- Check exhaust system.

117,000 Miles (187 000 km)

- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Lubricate steering linkage.
- Check exhaust system.

120,000 Miles (192 000 km)

- **Inspect engine air cleaner element, replace as necessary. Replace ignition cables.**
- **Replace spark plugs.**
- Inspect drive belt, adjust tension as necessary.
- Check engine coolant level, hoses, and clamps.
- Change engine oil.
- Replace engine oil filter.
- Inspect brake hoses.
- Inspect brake linings.
- Lubricate ball joints.
- Lubricate steering linkage.
- Drain and refill automatic transmission fluid.
- Check manual transmission fluid level.
- Drain and refill transfer case fluid.
- Change front and rear axle fluid.
- Check exhaust system.

Important: Inspection and service should also be performed any time a malfunction is observed or suspected.

PINION SEAL

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove wheel and tire assemblies.
- (3) Remove brake rotors (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL) and calipers (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL) .
- (4) Mark propeller shaft and pinion yoke for installation reference.
- (5) Remove propeller shaft from the yoke.
- (6) Rotate pinion gear three or four times.
- (7) Record rotating torque of the pinion gear with an inch pound torque wrench for installation reference.
- (8) Using Spanner Wrench 6958 to hold the pinion yoke, remove the pinion nut and washer.
- (9) Remove pinion yoke with Remover C-452 and Flange Wrench C-3281 (Fig. 1).

Fig. 1 Pinion Yoke

- 1 - WRENCH
2 - YOKE
3 - REMOVER

- (10) Remove pinion seal with a pry tool or a slide hammer mounted screw.

INSTALLATION

- (1) Apply a light coating of gear lubricant on the lip of pinion seal. Install seal with Installer C-3972-A and Handle C-4171 (Fig. 2).
- (2) Install yoke on the pinion gear with Installer W-162-D, Cup 8109 and Wrench 6958 (Fig. 3).

CAUTION: Do not exceed the minimum tightening torque 271 N·m (200 ft. lbs.) when installing the pinion yoke retaining nut at this point. Damage to collapsible spacer or bearings may result.

80a7e2be

Fig. 2 Pinion Seal

- 1 - HANDLE - C-4171
2 - INSTALLER - C-3972-A

Fig. 3 Pinion Yoke Installation

- 1 - PINION YOKE
2 - AXLE HOUSING

- (3) Install yoke washer and **new** nut on the pinion gear and tighten nut until there is zero bearing end-play.
- (4) Tighten the nut to 216 N·m (160 ft. lbs.).

CAUTION: Never loosen pinion gear nut to decrease pinion gear bearing rotating torque and never exceed specified preload torque. If preload torque or rotating torque is exceeded a new collapsible spacer must be installed.

- (5) Rotate the pinion shaft using an inch pound torque wrench. Rotating torque should be equal to the reading recorded during removal plus an additional 0.56 N·m (5 in. lbs.) (Fig. 4).

- (6) If the rotating torque is low, use Spanner Wrench 6958 to hold the pinion yoke (Fig. 5) and tighten pinion shaft nut in 6.8 N·m (5 ft. lbs.) increments until proper rotating torque is achieved.

PINION SEAL (Continued)

Fig. 4 Pinion Rotating Torque

- 1 - TORQUE WRENCH
- 2 - PINION YOKE

CAUTION: If the maximum tightening torque 353 N-m (260 ft. lbs.) is reached prior to reaching the required rotating torque, the collapsible spacer may have been damaged. Replace the collapsible spacer.

- (7) Install propeller shaft with reference marks aligned.
- (8) Check and fill with gear lubricant.
- (9) Install brake rotors (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION) and calipers (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
- (10) Install wheel and tire assemblies.
- (11) Lower the vehicle.

COLLAPSIBLE SPACER

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove wheel and tire assemblies.
- (3) Remove brake rotors (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL) and calipers (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
- (4) Mark propeller shaft and pinion yoke for installation reference.
- (5) Remove propeller shaft from the yoke.

80a0c504

Fig. 5 Tightening Pinion Shaft

- 1 - PINION FLANGE
- 2 - FRONT AXLE
- 3 - SPANNER WRENCH

- (6) Rotate pinion gear three or four times.
- (7) Record the rotating torque of the pinion gear with an inch pound torque wrench.
- (8) Hold the pinion yoke with Spanner Wrench 6958 and remove the pinion nut and washer.
- (9) Remove pinion yoke with Remover C-452 and Flange Wrench C-3281 (Fig. 6).

J9102-31

Fig. 6 Pinion Yoke

- 1 - SPECIAL TOOL C-3281
- 2 - YOKE
- 3 - SPECIAL TOOL C-452

COLLAPSIBLE SPACER (Continued)

(10) Remove pinion seal with a suitable pry tool or a slide hammer mounted screw.

(11) Remove front pinion bearing with a pair of pick tools to pull the bearing off the pinion gear shaft. If the bearing becomes bound on the shaft, lightly tap the end of the pinion gear with a rawhide/rubber hammer.

(12) Remove the collapsible spacer.

INSTALLATION

(1) Install **new** collapsible spacer on the pinion shaft.

(2) Install pinion front bearing.

(3) Apply a light coating of gear lubricant on the lip of pinion seal and install seal with Installer C-3972-A and Handle C-4171 (Fig. 7).

80a7e2be

Fig. 7 Pinion Seal

- 1 - HANDLE - C-4171
2 - INSTALLER - C-3972-A

(4) Install yoke with Installer W-162-D, Cup 8109 and Holder 6958 (Fig. 8).

80a7e2bf

Fig. 8 Pinion Yoke

- 1 - YOKE
2 - DIFFERENTIAL

(5) Install the pinion washer and a **new** nut and tighten the nut to 217 N-m (160 ft. lbs.).

CAUTION: Never loosen pinion gear nut to decrease pinion gear bearing rotating torque and never exceed specified preload torque. If preload torque is exceeded, a new collapsible spacer must be installed.

(6) Using yoke Spanner Wrench 6958 and a torque wrench set at 353 N-m (260 ft. lbs.), slowly tighten the nut (Fig. 9) in 6.8 N-m (5 ft. lbs.) increments until the rotating torque is achieved. Measure the rotating torque with inch pound torque wrench frequently to avoid over crushing the collapsible spacer (Fig. 10).

NOTE: If more than 353 N-m (260 ft. lbs.) torque is required to crush the collapsible spacer, the spacer is defective and must be replaced.

80a0c504

Fig. 9 Tightening Pinion Nut

- 1 - SPANNER WRENCH - 6958
2 - DIFFERENTIAL
3 - TORQUE WRENCH

(7) Rotating torque should be the recorded reading during removal, plus an additional 0.56 N-m (5 in. lbs.).

(8) Install propeller shaft with reference marks aligned.

COLLAPSIBLE SPACER (Continued)

**Fig. 10 Pinion Gear Rotation Torque**

- 1 - YOKE
2 - TORQUE WRENCH

(9) Install brake rotors (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION) and calipers (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION) .

- (10) Install wheel and tire assemblies.
(11) Lower vehicle.

PINION GEAR/RING GEAR

REMOVAL

NOTE: The ring and pinion gears are serviced as a matched set. Never replace one gear without replacing the other gear.

- (1) Raise and support the vehicle.
- (2) Mark pinion yoke and propeller shaft for installation reference.
- (3) Disconnect propeller shaft from pinion yoke and tie propeller shaft to underbody.
- (4) Remove differential from axle housing.
- (5) Secure differential case in a vise with soft metal jaw (Fig. 11).
- (6) Remove ring gear bolts from the differential case.
- (7) Drive ring gear off the differential case with a rawhide hammer (Fig. 11).

**Fig. 11 Ring Gear**

- 1 - DIFFERENTIAL CASE
2 - RING GEAR
3 - HAMMER

(8) Hold yoke with Spanner Wrench 6958 and remove the pinion nut and washer (Fig. 12).

**Fig. 12 Pinion Yoke**

- 1 - PIPE
2 - PINION YOKE
3 - SPANNER WRENCH - 6958
4 - LOWER CONTROL ARM

(9) Remove pinion yoke with Remover C-452 and Flange Wrench C-3281 (Fig. 13).

(10) Remove pinion and collapsible spacer from the housing (Fig. 14).

(11) Remove front pinion bearing cup, bearing, oil slinger, if equipped, and pinion seal with Remover D-103 and Handle C-4171 (Fig. 15).

(12) Remove rear pinion bearing cup from the housing (Fig. 16) with Remover D-149 and Handle C-4171.

(13) Remove collapsible spacer from pinion shaft (Fig. 17).

(14) Remove rear pinion bearing with Puller/Press C-293-PA and Adapters C-293-39 (Fig. 18).

Place 4 adapter blocks so they do not damage the bearing cage.

(15) Remove pinion depth shim/oil slinger from the pinion shaft and record thickness.

INSTALLATION

NOTE: A pinion depth shim/oil slinger is placed between the rear pinion bearing cone and the pinion head to achieve proper ring gear and pinion mesh. If ring gear and pinion are reused, the pinion depth shim/oil slinger should not require replacement. Refer to Adjustment (Pinion Gear Depth) to select the proper thickness shim/oil slinger if ring and pinion gears are replaced.

(1) Apply Mopar® Door Ease or equivalent lubricant to outside surface of rear pinion bearing cup. Install bearing cup with Installer D-146 and Driver Handle C-4171 (Fig. 19) and verify cup is seated.

(2) Apply Mopar® Door Ease or equivalent lubricant to outside surface of front pinion bearing cup. Install bearing cup with Installer D-130 and Handle C-4171 (Fig. 20) and verify cup is seated.

3 - PINION DEPTH SHIM/OIL BAFFLE
4 - DRIVE PINION
5 - REAR PINION BEARING

(6) Install **new** collapsible spacer on pinion shaft and install pinion into the housing (Fig. 23).

(7) Install yoke with Installer W-162-B, Cup 8109 and Spanner Wrench 6958 (Fig. 24).

(8) Install pinion washer and a **new** nut onto the pinion. Tighten the nut to 216 N·m (160 ft. lbs.).

CAUTION: Never loosen the pinion nut to decrease pinion bearing rotating torque and never exceed specified preload torque. If preload torque is exceeded a new collapsible spacer must be installed.

PINION GEAR/RING GEAR (Continued)

(9) Using Spanner Wrench 6958 and torque wrench set at 352 N·m (260 ft. lbs.) (Fig. 25). Slowly tighten the nut in 6.8 N·m (5 ft. lb.) increments until the rotating torque is achieved. Measure rotating torque frequently to avoid over crushing the collapsible spacer (Fig. 26).

CAUTION: If more than 352 N·m (260 ft. lbs.) torque is required to crush the collapsible spacer, the spacer is defective and must be replaced.

**Fig. 25 Tightening Pinion Nut - Typical**

- 1 - PINION FLANGE
- 2 - DIFFERENTIAL HOUSING
- 3 - SPANNER WRENCH - 6958

(10) Check bearing rotating torque with an inch pound torque wrench (Fig. 26). The torque necessary to rotate the pinion should be:

- Original Bearings: 1 to 2 N·m (10 to 20 in. lbs.).
- New Bearings: 1.7 to 3.4 N·m (15 to 30 in. lbs.).

(11) Invert the differential case and start two ring gear bolts. This will provide case-to-ring gear bolt hole alignment.

(12) Invert the differential case in the vise and install **new** ring gear bolts and alternately tighten to 108 N·m (80 ft. lbs.) (Fig. 27).

CAUTION: Do not reuse ring gear bolts, the bolts can fracture causing extensive damage.

PINION GEAR/RING GEAR (Continued)

**Fig. 26 Check Pinion Rotation Torque**

- 1 - TORQUE WRENCH
2 - PINION YOKE

(13) Install differential in the housing and verify differential bearing preload, gear mesh and contact pattern.

(14) Install differential cover and fill with gear lubricate.

**Fig. 27 Ring Gear Bolt**

- 1 - TORQUE WRENCH
2 - RING GEAR BOLT

REAR AXLE - 194RBI ADJUSTMENTS	14	
SPECIFICATIONS		22

REAR AXLE - 194RBI

ADJUSTMENT

Ring and pinion gears are supplied as matched sets only. The identifying numbers for the ring and pinion gear are etched into the face of each gear (Fig. 1). A plus (+) number, minus (-) number or zero (0) is etched into the face of the pinion gear. This number is the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion etched with a (0). The standard setting from the center line of the ring gear to the back face of the pinion is 96.850 mm (3.813 in.). The standard depth provides the best teeth contact pattern. Refer to Backlash and Contact Pattern Analysis Paragraph in this section for additional information.

Fig. 1 Pinion Gear ID Numbers

- 1 - PRODUCTION NUMBERS
- 2 - PINION GEAR DEPTH VARIANCE
- 3 - GEAR MATCHING NUMBER

Compensation for pinion depth variance is achieved with select shims. The shims are placed under the inner pinion bearing cone (Fig. 2).

80a5037a

Fig. 2 Adjustment Shim Locations

- 1 - PINION GEAR DEPTH SHIM
- 2 - DIFFERENTIAL BEARING SHIM
- 3 - RING GEAR
- 4 - DIFFERENTIAL BEARING SHIM
- 5 - COLLAPSIBLE SPACER

If a new gear set is being installed, note the depth variance etched into both the original and replacement pinion gear. Add or subtract the thickness of the original depth shims to compensate for the difference in the depth variances. Refer to the Depth Variance charts.

Note where Old and New Pinion Marking columns intersect. Intersecting figure represents plus or minus amount needed.

Note the etched number on the face of the drive pinion gear (-1, -2, 0, +1, +2, etc.). The numbers represent thousands of an inch deviation from the standard. If the number is negative, add that value to the required thickness of the depth shim(s). If the number is positive, subtract that value from the thickness of the depth shim(s). If the number is 0 no change is necessary. Refer to the Pinion Gear Depth Variance Chart.

REAR AXLE - 194RBI (Continued)

PINION DEPTH MEASUREMENT

Measurements are taken with pinion cups and pinion bearings installed in the housing. Take measurements with a Pinion Gauge Set, Pinion Block 6735, Arbor Discs 6732 and Dial Indicator C-3339 (Fig. 3).

(1) Assemble Pinion Height Block 6739, Pinion Block 6735 and rear pinion bearing onto Screw 6741 (Fig. 3).

(2) Insert assembled height gauge components, rear bearing and screw into the housing through pinion bearing cups (Fig. 4).

(3) Install front pinion bearing and Cone 6740 hand tight (Fig. 3).

(4) Place Arbor Disc 6732 on Arbor D-115-3 in position in the housing side bearing cradles (Fig. 5). Install differential bearing caps on Arbor Discs and tighten cap bolts. Refer to the Torque Specifications in this section.

NOTE: Arbor Discs 6732 have different step diameters to fit other axle sizes. Pick correct size step for axle being serviced.

**Fig. 5 Gauge Tools In Housing**

- 1 - ARBOR DISC
- 2 - PINION BLOCK
- 3 - ARBOR
- 4 - PINION HEIGHT BLOCK

(5) Assemble Dial Indicator C-3339 into Scooter Block D-115-2 and secure set screw.

(6) Place Scooter Block/Dial Indicator in position in axle housing so dial probe and scooter block are flush against the surface of the pinion height block. Hold scooter block in place and zero the dial indicator. Tighten dial indicator face lock screw.

(7) With scooter block still in position against the pinion height block, slowly slide the dial indicator probe over the edge of the pinion height block. Observe how many revolutions counterclockwise the dial pointer travels (approximately 0.125 in.) to the out-stop of the dial indicator.

(8) Slide the dial indicator probe across the gap between the pinion height block and the arbor bar with the scooter block against the pinion height block (Fig. 6). When the dial probe contacts the arbor bar, the dial pointer will turn clockwise. Continue moving the dial probe to the crest of the arbor bar and record the highest reading. If the dial indicator can not achieve the zero reading, the rear bearing cup or the pinion depth gauge set is not installed correctly.

(9) Select a shim equal to the dial indicator reading plus the drive pinion gear depth variance number etched in the face of the pinion gear (Fig. 1) using the opposite sign on the variance number. For example, if the depth variance is -2, add +0.002 in. to the dial indicator reading.

**Fig. 6 Pinion Gear Depth Measurement**

- 1 - ARBOR
- 2 - SCOOTER BLOCK
- 3 - DIAL INDICATOR

(10) Remove the pinion depth gauge components from the housing

DIFFERENTIAL BEARING PRELOAD

Differential side bearing preload and gear backlash is achieved by selective shims inserted between the bearing cup and the housing. The proper shim thickness can be determined using slip-fit Dummy Bearings D-348 in place of the differential side bearings and a Dial Indicator C-3339. Before proceeding with the differential bearing preload and gear backlash measurements, measure the pinion gear depth and prepare the pinion gear for installation. Establishing proper pinion gear depth is essential to establishing gear backlash and tooth contact patterns. After the overall shim thickness to take up differential side play is measured, the pinion gear is installed and the gear backlash shim thickness is measured. The overall shim thickness is the total of the dial indicator reading, starting point shim thickness and the pre-

REAR AXLE - 194RBI (Continued)

load specification added together. The gear backlash measurement determines the thickness of the shim used on the ring gear side of the differential case. Subtract the gear backlash shim thickness from the total overall shim thickness and select that amount for the pinion gear side of the differential (Fig. 7).

PRELOAD SHIM SELECTION

NOTE: It is difficult to salvage the differential side bearings during the removal procedure. Install replacement bearings if necessary.

- (1) Remove side bearings from differential case.
- (2) Install ring gear, if necessary, on differential case and tighten bolts to specification.
- (3) Install Dummy Bearings D-348 on differential case.
- (4) Install differential case in the housing.
- (5) Insert Dummy Shims 8107 (0.118 in. / 3.0 mm) starting point shims between the dummy bearing and the housing (Fig. 8).
- (6) Install bearing caps in their correct positions and snug the bolts.
- (7) Using a dead-blow hammer to seat the differential dummy bearings to each side of the housing (Fig. 9) and (Fig. 10).

80a534d2

(10) Push the differential case firmly to the pinion gear side of the housing (Fig. 12) and zero dial indicator.

80a7e2fe

Fig. 12 Zero Dial Indicator

- 1 - FORCE CASE TO PINION SIDE
- 2 - PILOT STUD
- 3 - DIAL INDICATOR EXTENSION
- 4 - DIAL INDICATOR

(11) Push differential case firmly to the ring gear side and record dial indicator reading (Fig. 13).

80a534d5

Fig. 13 Read Dial Indicator

- 1 - DIAL INDICATOR
- 2 - FORCE CASE TO RING GEAR SIDE
- 3 - DIFFERENTIAL HOUSING

(12) Add the dial indicator reading to the starting point shim thickness to determine total shim thickness to achieve zero differential end play.

(13) Add 0.008 in. (0.2 mm) to the zero end play total. This new total represents the thickness of shims to compress or preload the new bearings when the differential is installed.

REAR AXLE - 194RBI (Continued)

- (14) Rotate dial indicator out of the way.
- (15) Remove differential case, dummy bearings and starting point shims from the housing.
- (16) Install pinion gear in the housing. Install the yoke and establish the correct pinion rotating torque.
- (17) Install differential case and dummy bearings in the housing (without shims) and tighten retaining cap bolts.
- (18) Position the dial indicator plunger on a flat surface between the ring gear bolt heads (Fig. 11).
- (19) Push and hold differential case toward pinion gear.
- (20) Zero dial indicator face to pointer.
- (21) Push and hold differential case to ring gear side of the housing and record dial indicator reading.
- (22) Subtract 0.002 in. (0.05 mm) from the dial indicator reading to compensate for backlash between ring and pinion gears. This total is the thickness of shim required to achieve proper backlash.
- (23) Subtract the backlash shim thickness from the total preload shim thickness. The remainder is the shim thickness required on the pinion side of the housing.
- (24) Rotate dial indicator out of the way on pilot stud.
- (25) Remove differential case and dummy bearings from the housing.
- (26) Install new side bearing cones and cups on differential case.
- (27) Install spreader W-129-B and some components of Adapter Set 6987 on differential housing and spread axle opening enough to receive differential case.
- (28) Place side bearing shims into the housing against the axle tubes.
- (29) Install differential case in the housing.
- (30) Rotate the differential case several times to seat the side bearings.
- (31) Position the indicator plunger against a ring gear tooth (Fig. 14).
- (32) Push and hold ring gear upward while not allowing the pinion gear to rotate.
- (33) Zero dial indicator face to pointer.
- (34) Push and hold ring gear downward while not allowing the pinion gear to rotate. Dial indicator reading should be between 0.12 mm (0.005 in.) and 0.20 mm (0.008 in.). If backlash is not within specifications transfer the necessary amount of shim thickness from one side of the differential housing to the other (Fig. 15).
- (35) Verify differential case and ring gear runout by measuring ring to pinion gear backlash at eight locations around the ring gear. Readings should not vary more than 0.05 mm (0.002 in.). If readings vary more than specified, the ring gear or the differential case is defective.

Fig. 14 Ring Gear Backlash

1 - DIAL INDICATOR

After the proper backlash is achieved, perform the Gear Contact Pattern Analysis procedure.

Fig. 15 Backlash Shim

REAR AXLE - 194RBI (Continued)

GEAR CONTACT PATTERN

The ring gear and pinion teeth contact patterns will show if the pinion depth is correct in the housing. It will also show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

(1) Apply a thin coat of hydrated ferric oxide or equivalent to the drive and coast side of the ring gear teeth.

(2) Wrap, twist, and hold a shop towel around the pinion yoke to increase the turning resistance of the pinion. This will provide a more distinct contact pattern.

(3) With a boxed end wrench on a ring gear bolt, rotate the differential case one complete revolution in both directions while a load is being applied from shop towel.

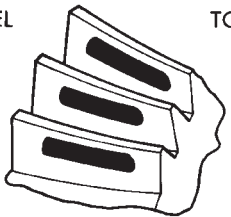

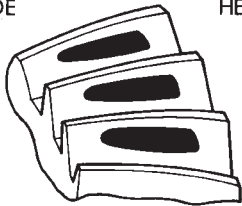

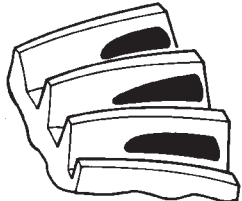

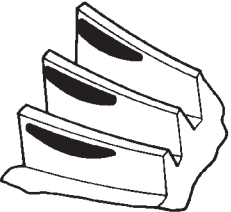

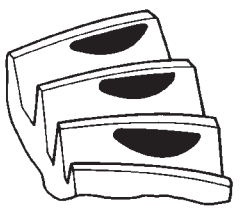

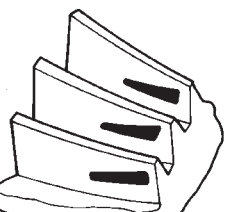

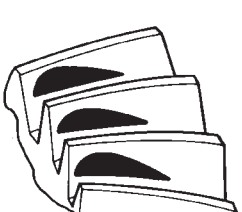

The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will squeeze the compound to the areas with the least amount of contact. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart (Fig. 16) and adjust pinion depth and gear backlash as necessary.

DIFFERENTIAL BEARING PRELOAD CHECK

The final check on the differential assembly before installing the axles is torque to rotate pinion and differential combined. This will verify the correct differential bearing preload.

Torque to rotate the differential and pinion should be the torque to rotate the pinion plus 0.79-1.24 N·m (7-11 in. lbs.).

ADJUSTMENTS

Ring gears and pinions are supplied as matched sets only. The identifying numbers for the ring gear and pinion are etched into the face of each gear (Fig. 1). A plus (+) number, minus (–) number or zero (0) is etched into the face of the pinion. This number is the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion etched with a (0). The standard depth provides the best gear tooth contact pattern. Refer to Backlash and Contact Pattern Analysis paragraph in this section for additional information.

Fig. 1 Pinion Gear ID Numbers

- 1 - PRODUCTION NUMBERS
- 2 - DRIVE PINION GEAR DEPTH VARIANCE
- 3 - GEAR MATCHING NUMBER (SAME AS RING GEAR NUMBER)

Compensation for pinion depth variance is achieved with select shims. The shims are placed behind the rear pinion bearing (Fig. 2).

80a0c4f8

Fig. 2 Adjustment Shim Locations

- 1 - DIFFERENTIAL HOUSING
- 2 - COLLAPSIBLE SPACER
- 3 - REAR PINION BEARING
- 4 - PINION DEPTH SHIM
- 5 - PINION GEAR
- 6 - BEARING CUP

If a new gear set is being installed, note the depth variance etched into both the original and replacement pinion. Add or subtract the thickness of the original depth shims to compensate for the difference in the depth variances. Refer to the Depth Variance chart.

Note where Old and New Pinion Marking columns intersect. Intersecting figure represents plus or minus the amount needed.

Note the etched number on the face of the pinion gear head (–1, –2, 0, +1, +2, etc.). The numbers represent thousands of an inch deviation from the standard. If the number is negative, add that value to the required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim. If the number is 0 no change is necessary.

REAR AXLE - 8 1/4 (Continued)

PINION GEAR DEPTH VARIANCE

PINION DEPTH MEASUREMENT

Measurements are taken with pinion bearing cups and pinion bearings installed in the housing. Take measurements with Pinion Gauge Set and Dial Indicator C-3339.

(1) Assemble Pinion Height Block 6739, Pinion Block 8540 and rear pinion bearing onto Screw 6741 (Fig. 3).

(2) Insert assembled height gauge components, rear bearing, and screw into the housing through pinion bearing cups (Fig. 4).

(3) Install front pinion bearing and Cone-Nut 6740 hand tight (Fig. 3).

(4) Place Arbor Disc 8541 on Arbor D-115-3 in position in the housing side bearing cradles (Fig. 5). Install differential bearing caps on Arbor Discs and tighten cap bolts to 41 N·m (30 ft. lbs.).

NOTE: Arbor Discs 8541 has different step diameters to fit other axles. Choose proper step for axle being serviced.

(5) Assemble Dial Indicator C-3339 into Scooter Block D-115-2 and secure set screw.

(6) Place Scooter Block/Dial Indicator in position in axle housing so dial probe and scooter block are flush against the rearward surface of the pinion height block (Fig. 3). Hold scooter block in place and zero the dial indicator. Tighten dial indicator face lock screw.

(7) Slowly slide the dial indicator probe over the edge of the pinion height block.

2 - SCOOTER BLOCK
3 - DIAL INDICATOR

**Fig. 5 Gauge Tools In Housing**

- 1 - ARBOR DISC
2 - PINION BLOCK
3 - ARBOR
4 - PINION HEIGHT BLOCK

(8) Slide the dial indicator probe across the gap between the pinion height block and the arbor bar with the scooter block against the pinion height block (Fig. 6). When the dial probe contacts the arbor bar, the dial pointer will turn clockwise. Continue moving the dial probe to the crest of the arbor bar and record the highest reading. If the dial indicator can not achieve the zero reading, the rear bearing cup or the pinion depth gauge set is not installed correctly.

(9) Select a shim equal to the dial indicator reading plus the drive pinion gear depth variance number etched in the face of the pinion (Fig. 1). For example, if the depth variance is -2, add +0.002 in. to the dial indicator reading.

BEARING PRELOAD AND GEAR BACKLASH

The following must be considered when adjusting bearing preload and gear backlash:

- The maximum ring gear backlash variation is 0.003 inch (0.076 mm).
- Mark the gears so the same teeth are meshed during all backlash measurements.
- Maintain the torque while adjusting the bearing preload and ring gear backlash.
- Excessive adjuster torque will introduce a high bearing load and cause premature bearing failure. Insufficient adjuster torque can result in excessive differential case free-play and ring gear noise.
- Insufficient adjuster torque will not support the ring gear correctly and can cause excessive differential case free-play and ring gear noise.

NOTE: The differential bearing cups will not always immediately follow the threaded adjusters as they are moved during adjustment. To ensure accurate bearing cup responses to the adjustments:

- Maintain the gear teeth engaged (meshed) as marked.
- The bearings must be seated by rapidly rotating the pinion gear a half turn back and forth.
- Do this five to ten times each time the threaded adjusters are adjusted.

(1) Use Wrench C-4164 to adjust each threaded adjuster inward until the differential bearing free-play is eliminated (Fig. 7). Allow some ring gear backlash (approximately 0.01 inch/0.25 mm) between the ring and pinion gear. Seat the bearing cups with the procedure described above.

REAR AXLE - 8 1/4 (Continued)

**Fig. 7 Threaded Adjuster**

- 1 - AXLE TUBE
- 2 - BACKING PLATE
- 3 - ADJUSTER WRENCH

(2) Install dial indicator and position the plunger against the drive side of a ring gear tooth (Fig. 8). Measure the backlash at 4 positions (90 degrees apart) around the ring gear. Locate and mark the area of minimum backlash.

(3) Rotate the ring gear to the position of the least backlash. Mark the gear so that all future backlash measurements will be taken with the same gear teeth meshed.

**Fig. 8 Ring Gear Backlash**

- 1 - DIAL INDICATOR
- 2 - RING GEAR
- 3 - EXCITER RING

(4) Loosen the right-side, tighten the left-side threaded adjuster. Obtain backlash of 0.003 to 0.004 inch (0.076 to 0.102 mm) with each adjuster tight-

ened to 14 N-m (10 ft. lbs.). Seat the bearing cups with the procedure described above.

(5) Tighten the differential bearing cap bolts 95 N-m (70 ft. lbs.).

(6) Tighten the right-side threaded adjuster to 102 N-m (75 ft. lbs.). Seat the bearing cups with the procedure described above. Continue to tighten the right-side adjuster and seat bearing cups until the torque remains constant at 102 N-m (75 ft. lbs.).

(7) Measure the ring gear backlash. The range of backlash is 0.006 to 0.008 inch (0.15 to 0.203 mm).

(8) Continue increasing the torque at the right-side threaded adjuster until the specified backlash is obtained.

NOTE: The left-side threaded adjuster torque should have approximately 102 N-m (75 ft. lbs.). If the torque is considerably less, the complete adjustment procedure must be repeated.

(9) Tighten the left-side threaded adjuster until 102 N-m (75 ft. lbs.) torque is indicated. Seat the bearing rollers with the procedure described above. Do this until the torque remains constant.

(10) Install the threaded adjuster locks and tighten the lock screws to 10 N-m (90 in. lbs.).

After the proper backlash is achieved, perform the Gear Contact Pattern procedure.

GEAR CONTACT PATTERN

The ring gear and pinion teeth contact patterns will show if the pinion depth is correct in the housing. It will also show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

(1) Apply a thin coat of hydrated ferric oxide or equivalent, to the drive and coast side of the ring gear teeth.

(2) Wrap, twist and hold a shop towel around the pinion yoke to increase the turning resistance of the pinion. This will provide a more distinct contact pattern.

(3) With a boxed end wrench on a ring gear bolt, rotate the differential case one complete revolution in both directions while a load is being applied from shop towel.

The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will squeeze the compound to the areas with the least amount of contact. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart (Fig. 9) and adjust pinion depth and gear backlash as necessary.

		<p>PINION GEAR DEPTH SHIM CORRECT. INCREASE RING GEAR BACKLASH.</p>

J9003-24

Fig. 9 Gear Tooth Contact Patterns

REAR AXLE - 8 1/4 (Continued)

SIDE GEAR CLEARANCE

When measuring side gear clearance, check each gear independently. If it necessary to replace a side gear, replace both gears as a matched set.

(1) Install the axle shafts and C-locks and pinion mate shaft.

(2) Measure each side gear clearance. Insert a matched pair of feeler gauge blades between the gear and differential housing on opposite sides of the hub (Fig. 10) .

Fig. 10 Side Gear Clearance

- 1 - FEELER GAUGE BLADES
2 - SIDE GEAR

(3) If side gear clearances is no more than 0.005 inch. Determine if the axle shaft is contacting the pinion mate shaft. **Do not remove the feeler gauges, inspect the axle shaft with the feeler gauge inserted behind the side gear.** If the end of the axle shaft is not contacting the pinion mate shaft, the side gear clearance is acceptable.

(4) If clearance is more than 0.005 inch (axle shaft not contacting mate shaft), record the side gear clearance. Remove the thrust washer and measure its thickness with a micrometer. Add the washer thickness to the recorded side gear clearance. The sum of gear clearance and washer thickness will determine required thickness of replacement thrust washer (Fig. 11).

SIDE GEAR CLEARANCE	0.007
THRUST WASHER THICKNESS	+ 0.033
TOTAL	0.040
REPLACEMENT WASHER THICKNESS	0.040
NEW SIDE GEAR CLEARANCE	- 0.037
	0.003
	J9203-31

Fig. 11 Side Gear Calculations

In some cases, the end of the axle shaft will move and contact the mate shaft when the feeler gauge is inserted. The C-lock is preventing the side gear from sliding on the axle shaft.

(5) If there is no side gear clearance, remove the C-lock from the axle shaft. Use a micrometer to measure the thrust washer thickness. Record the thickness and re-install the thrust washer. Assemble the differential case without the C-lock installed and re-measure the side gear clearance.

(6) Compare both clearance measurements. If the difference is less than 0.012 inch (0.305 mm), add clearance recorded when the C-lock was installed to thrust washer thickness measured. The sum will determine the required thickness of the replacement thrust washer.

(7) If clearance is 0.012 inch (0.305 mm) or greater, both side gears must be replaced (matched set) and the clearance measurements repeated.

(8) If clearance (above) continues to be 0.012 inch (0.305 mm) or greater, the case must be replaced.

WIRING DIAGRAM
INFORMATIONDESCRIPTION - HOW TO USE WIRING
DIAGRAMS

DaimlerChrysler Corporation wiring diagrams are designed to provide information regarding the vehicles wiring content. In order to effectively use the wiring diagrams to diagnose and repair DaimlerChrysler Corporation vehicles, it is important to understand all of their features and characteristics.

Diagrams are arranged such that the power (B+) side of the circuit is placed near the top of the page, and the ground (B-) side of the circuit is placed near the bottom of the page (Fig. 1).

All switches, components, and modules are shown in the at rest position with the doors closed and the key removed from the ignition (Fig. 2).

Components are shown two ways. A solid line around a component indicates that the component is complete. A dashed line around the component indicates that the component is being shown is not complete. Incomplete components have a reference number to indicate the page where the component is shown complete.

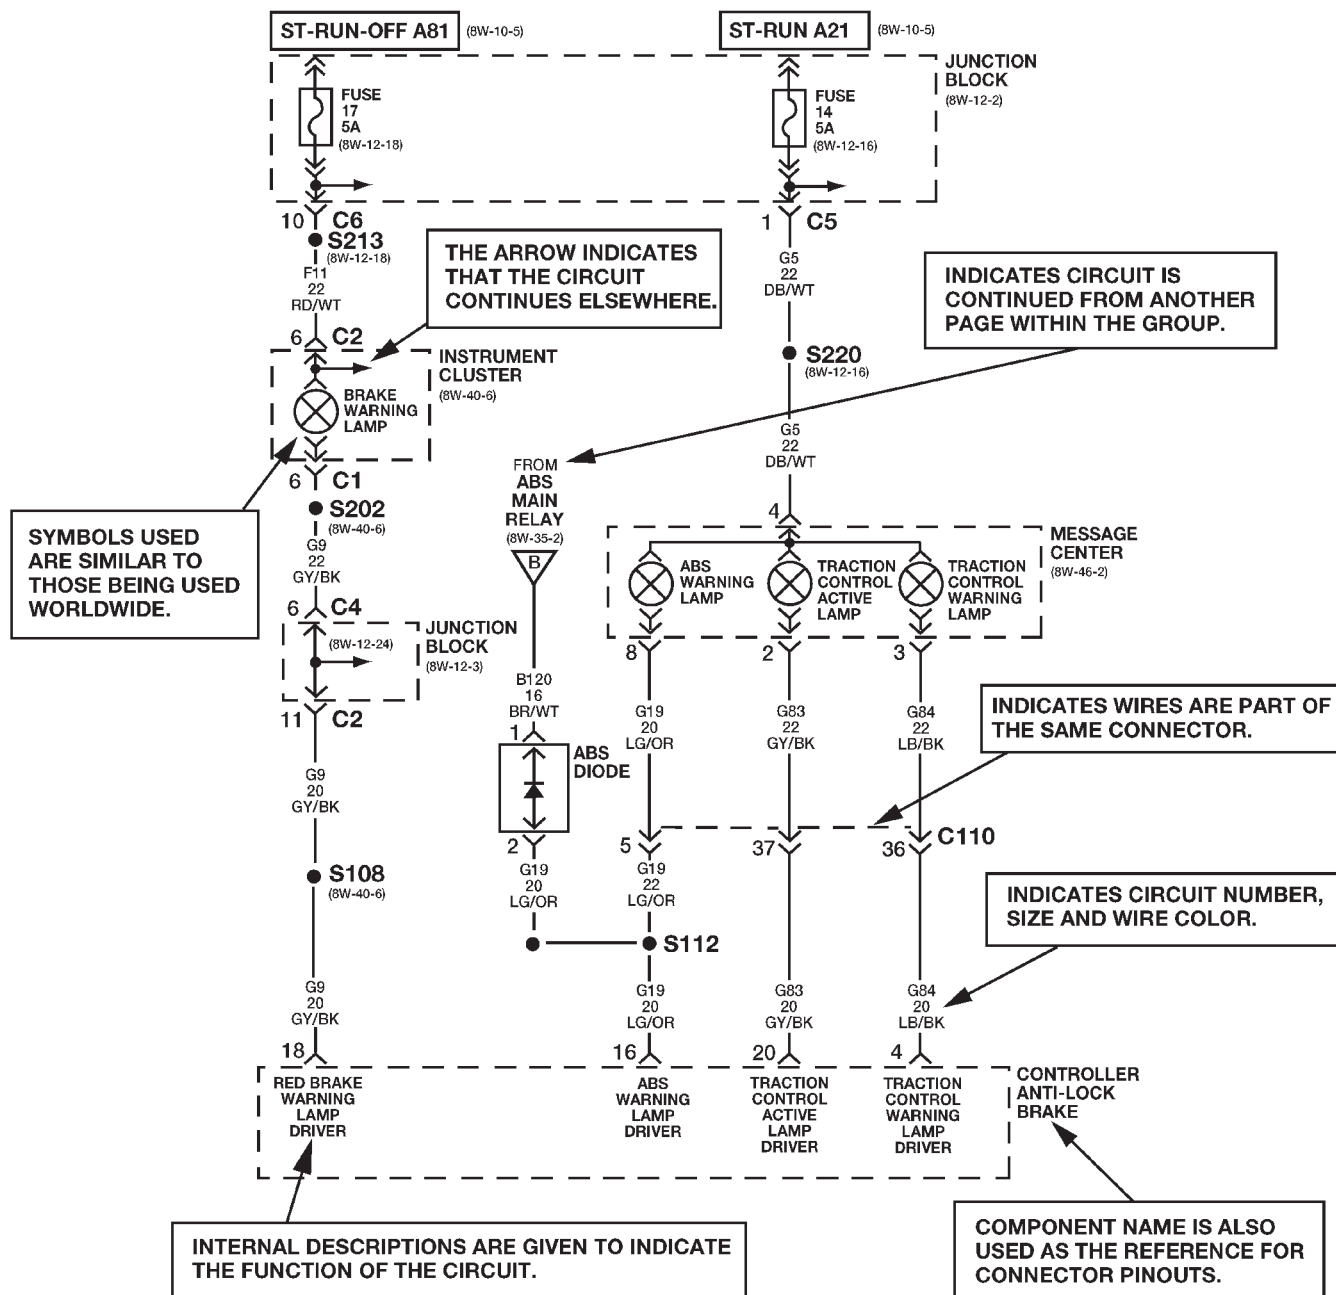

It is important to realize that no attempt is made on the diagrams to represent components and wiring as they appear on the vehicle. For example, a short piece of wire is treated the same as a long one. In addition, switches and other components are shown as simply as possible, with regard to function only.

SYMBOLS

International symbols are used throughout the wiring diagrams. These symbols are consistent with those being used around the world (Fig. 3).

WIRING DIAGRAM INFORMATION (Continued)

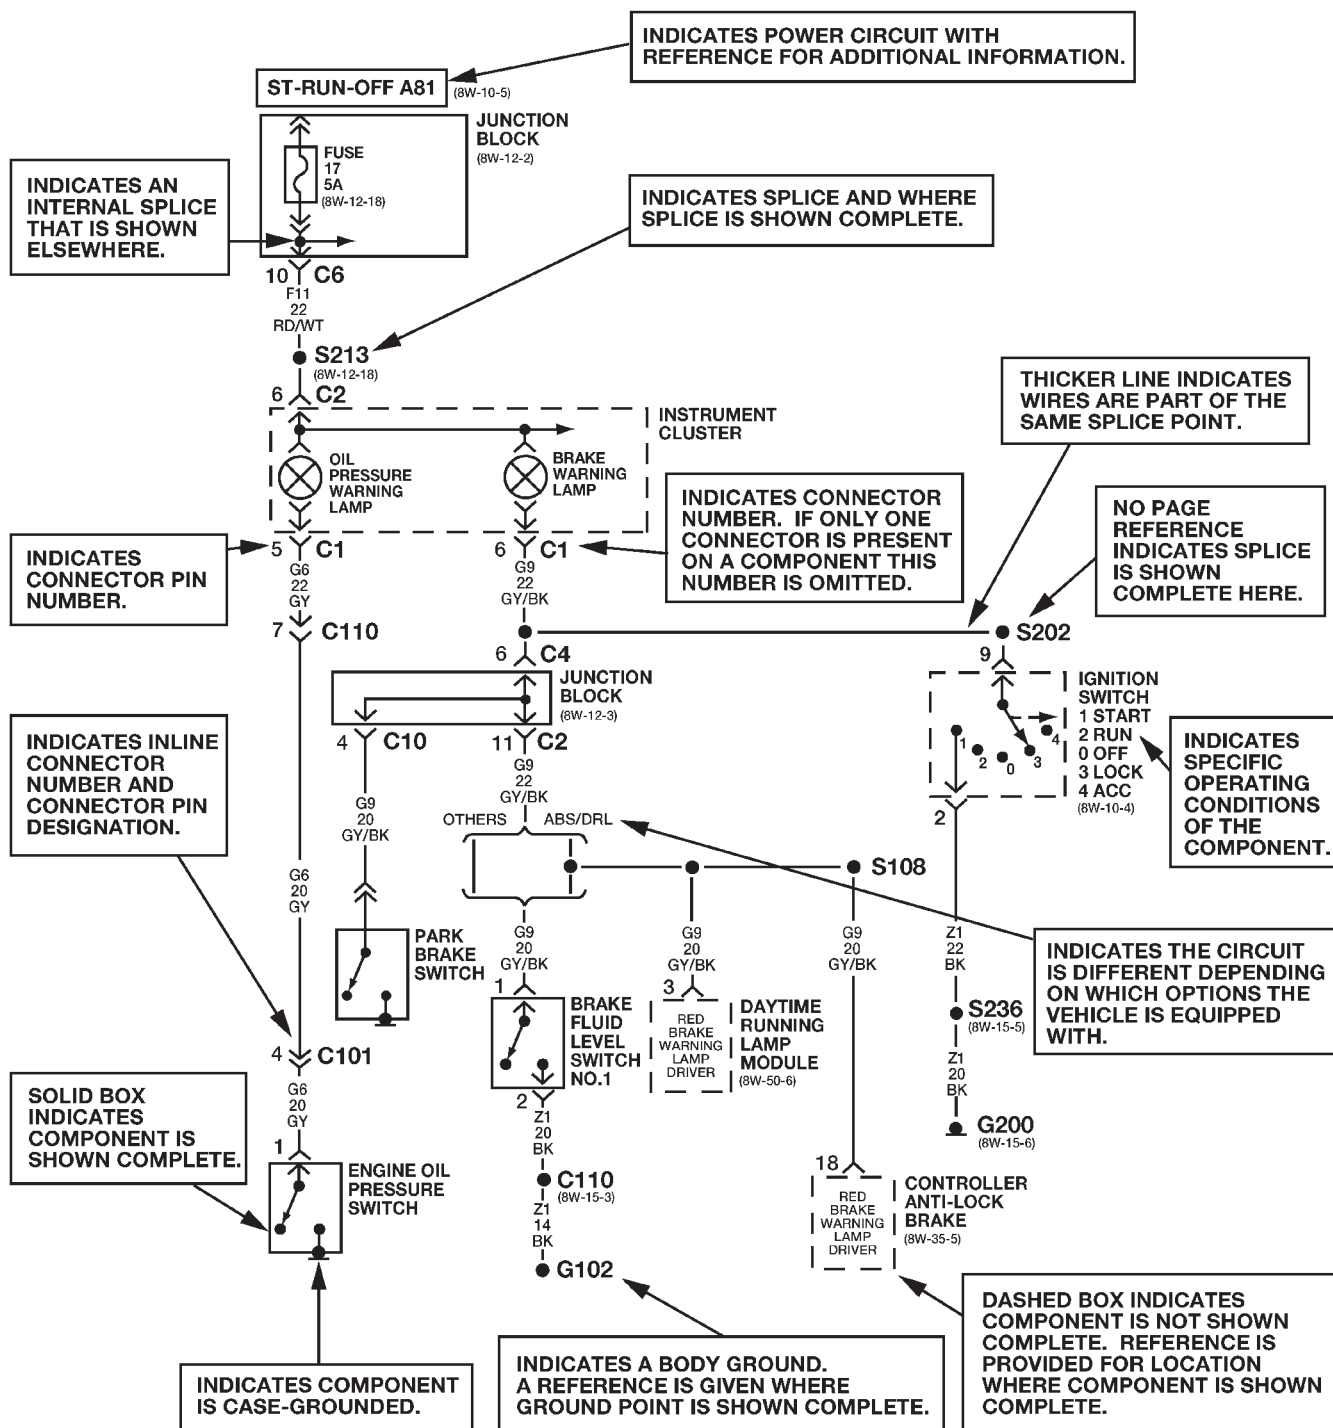

DIAGRAMS ARE ARRANGED WITH THE POWER B+ SIDE OF THE CIRCUIT NEAR THE TOP OF THE PAGE, AND THE GROUND SIDE OF THE CIRCUIT NEAR THE BOTTOM OF THE PAGE.

The System shown here is an **EXAMPLE ONLY**. It does not represent the actual circuit shown in the **WIRING DIAGRAM SECTION**.

TERMINOLOGY

This is a list of terms and definitions used in the wiring diagrams.

LHD	Left Hand Drive Vehicles
RHD	Right Hand Drive Vehicles
ATX ..	Automatic Transmissions-Front Wheel Drive
MTX	Manual Transmissions-Front Wheel Drive
AT	Automatic Transmissions-Rear Wheel Drive
MT	Manual Transmissions-Rear Wheel Drive
SOHC	Single Over Head Cam Engine
DOHC	Double Over Head Cam Engine
Built-Up-Export	Vehicles Built For Sale In Markets Other Than North America
Except-Built-Up-Export ..	Vehicles Built For Sale In North America

WARNINGS - GENERAL

WARNINGS provide information to prevent personal injury and vehicle damage. Below is a list of general warnings that should be followed any time a vehicle is being serviced.

WARNING:: ALWAYS WEAR SAFETY GLASSES FOR EYE PROTECTION.

WARNING: USE SAFETY STANDS ANYTIME A PROCEDURE REQUIRES BEING UNDER A VEHICLE.

WARNING: BE SURE THAT THE IGNITION SWITCH ALWAYS IS IN THE OFF POSITION, UNLESS THE PROCEDURE REQUIRES IT TO BE ON.

WARNING: SET THE PARKING BRAKE WHEN WORKING ON ANY VEHICLE. AN AUTOMATIC TRANSMISSION SHOULD BE IN PARK. A MANUAL TRANSMISSION SHOULD BE IN NEUTRAL.

WARNING: OPERATE THE ENGINE ONLY IN A WELL-VENTILATED AREA.

WARNING: KEEP AWAY FROM MOVING PARTS WHEN THE ENGINE IS RUNNING, ESPECIALLY THE FAN AND BELTS.

WARNING: TO PREVENT SERIOUS BURNS, AVOID CONTACT WITH HOT PARTS SUCH AS THE RADIA-

TOR, EXHAUST MANIFOLD(S), TAIL PIPE, CATALYTIC CONVERTER AND MUFFLER.

WARNING: DO NOT ALLOW FLAME OR SPARKS NEAR THE BATTERY. GASES ARE ALWAYS PRESENT IN AND AROUND THE BATTERY.

WARNING: ALWAYS REMOVE RINGS, WATCHES, LOOSE HANGING JEWELRY AND LOOSE CLOTHING.

DIAGNOSIS AND TESTING - WIRING HARNESS

TROUBLESHOOTING TOOLS

When diagnosing a problem in an electrical circuit there are several common tools necessary. These tools are listed and explained below.

- **Jumper Wire** - This is a test wire used to connect two points of a circuit. It can be used to bypass an open in a circuit.

WARNING: NEVER USE A JUMPER WIRE ACROSS A LOAD, SUCH AS A MOTOR, CONNECTED BETWEEN A BATTERY FEED AND GROUND.

- **Voltmeter** - Used to check for voltage on a circuit. Always connect the black lead to a known good ground and the red lead to the positive side of the circuit.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking voltages in these circuits, use a meter with a 10 - megohm or greater impedance rating.

- Ohmmeter - Used to check the resistance between two points of a circuit. Low or no resistance in a circuit means good continuity.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking resistance in these circuits use a meter with a 10 - megohm or greater impedance rating. In addition, make sure the power is disconnected from the circuit. Circuits that are powered up by the vehicle's electrical system can cause damage to the equipment and provide false readings.

WIRING DIAGRAM INFORMATION (Continued)

• **Probing Tools** - These tools are used for probing terminals in connectors (Fig. 4) Select the proper size tool from Special Tool Package 6807, and insert it into the terminal being tested. Use the other end of the tool to insert the meter probe.

948W-233

Fig. 4 PROBING TOOL

- 1 - SPECIAL TOOL 6801
2 - PROBING END

INTERMITTENT AND POOR CONNECTIONS

Most intermittent electrical problems are caused by faulty electrical connections or wiring. It is also possible for a sticking component or relay to cause a problem. Before condemning a component or wiring assembly, check the following items.

- Connectors are fully seated
- Spread terminals, or terminal push out
- Terminals in the wiring assembly are fully seated into the connector/component and locked into position
- Dirt or corrosion on the terminals. Any amount of corrosion or dirt could cause an intermittent problem
- Damaged connector/component casing exposing the item to dirt or moisture
- Wire insulation that has rubbed through causing a short to ground
- Some or all of the wiring strands broken inside of the insulation
- Wiring broken inside of the insulation

TROUBLESHOOTING WIRING PROBLEMS

When troubleshooting wiring problems there are six steps which can aid in the procedure. The steps are listed and explained below. Always check for non-factory items added to the vehicle before doing any

diagnosis. If the vehicle is equipped with these items, disconnect them to verify these add-on items are not the cause of the problem.

- (1) Verify the problem.
- (2) Verify any related symptoms. Do this by performing operational checks on components that are in the same circuit. Refer to the wiring diagrams.
- (3) Analyze the symptoms. Use the wiring diagrams to determine what the circuit is doing, where the problem most likely is occurring and where the diagnosis will continue.
- (4) Isolate the problem area.
- (5) Repair the problem area.
- (6) Verify the proper operation. For this step, check for proper operation of all items on the repaired circuit. Refer to the wiring diagrams.

STANDARD PROCEDURE - TESTING FOR VOLTAGE POTENTIAL

- (1) Connect the ground lead of a voltmeter to a known good ground (Fig. 5).
- (2) Connect the other lead of the voltmeter to the selected test point. The vehicle ignition may need to be turned ON to check voltage. Refer to the appropriate test procedure.

948W-194

Fig. 5 Testing for Voltage Potential

WIRING DIAGRAM INFORMATION (Continued)

STANDARD PROCEDURE - TESTING FOR CONTINUITY

- (1) Remove the fuse for the circuit being checked or, disconnect the battery.
- (2) Connect one lead of the ohmmeter to one side of the circuit being tested (Fig. 6)
- (3) Connect the other lead to the other end of the circuit being tested. Low or no resistance means good continuity.

948W-195

Fig. 6 Testing for Continuity

1 - FUSE REMOVED FROM CIRCUIT

STANDARD PROCEDURE - TESTING FOR A SHORT TO GROUND

- (1) Remove the fuse and disconnect all items involved with the fuse.
- (2) Connect a test light or a voltmeter across the terminals of the fuse.
- (3) Starting at the fuse block, wiggle the wiring harness about six to eight inches apart and watch the voltmeter/test lamp.
- (4) If the voltmeter registers voltage or the test lamp glows, there is a short to ground in that general area of the wiring harness.

STANDARD PROCEDURE - TESTING FOR SHORT TO GROUND ON FUSES POWERING SEVERAL LOADS

- (1) Refer to the wiring diagrams and disconnect or isolate all items on the suspected fused circuits.
- (2) Replace the blown fuse.
- (3) Supply power to the fuse by turning ON the ignition switch or re-connecting the battery.
- (4) Start connecting the items in the fuse circuit one at a time. When the fuse blows the circuit with the short to ground has been isolated.

STANDARD PROCEDURE - TESTING FOR A VOLTAGE DROP

- (1) Connect the positive lead of the voltmeter to the side of the circuit closest to the battery (Fig. 7).
- (2) Connect the other lead of the voltmeter to the other side of the switch or component.
- (3) Operate the item.
- (4) The voltmeter will show the difference in voltage between the two points.

CONNECTOR - AUGAT

REMOVAL

- (1) Disconnect battery.

- (2) Disconnect the connector from its mating half/component.

- (3) Push down on the yellow connector locking tab to release the terminals (Fig. 8).

958W-54

Fig. 8 AUGAT CONNECTOR REPAIR

- 1 - LOCKING TAB
- 2 - CONNECTOR

- (4) Using special tool 6932, push the terminal to remove it from the connector (Fig. 9).

803f5845

Fig. 9 USING

- 1 - SPECIAL TOOL 6932
- 2 - CONNECTOR

- (5) Repair or replace the terminal as necessary.

CONNECTOR - AUGAT (Continued)

INSTALLATION

- (1) Reset the terminal locking tang.
- (2) Insert the removed wire in the same cavity on the repair connector.
- (3) Repeat steps for each wire in the connector, being sure that all wires are inserted into the proper cavities. For additional connector pin-out identification, refer to the wiring diagrams.
- (4) When the connector is re-assembled, the locking tab must be placed in the locked position to prevent terminal push out.
- (5) Connect connector to its mating half/component.
- (6) Connect battery and test all affected systems.

CONNECTOR - MOLEX

REMOVAL

- (1) Disconnect battery.
- (2) Disconnect the connector from its mating half/component.
- (3) Insert special tool 6742 into the terminal end of the connector (Fig. 10).

Fig. 13 REMOVING WIRE TERMINAL

1 - SPECIAL TOOL 6934

(5) Grasp the wire and tool 6934, then slowly remove the wire and terminal from the connector.

(6) Repair or replace the terminal as necessary.

INSTALLATION

(1) Reset the terminal locking tang.

(2) Insert the removed wire in the same cavity on the repair connector.

(3) Repeat steps for each wire in the connector, being sure that all wires are fully seated into the proper cavities. For additional connector pin-out identification, refer to the wiring diagrams.

(4) Push in the single lock tab on the side of the connector (Fig. 14).

(5) Connect connector to its mating half/component.

(6) Connect battery and test all affected systems.

DIODE

REMOVAL

(1) Disconnect the battery.

(2) Locate the diode in the harness, and remove the protective covering.

(3) Remove the diode from the harness, pay attention to the current flow direction (Fig. 15).

Fig. 14 SINGLE LOCK TAB

1 - SINGLE LOCK TAB

948W-197

Fig. 15 DIODE IDENTIFICATION

1 - CURRENT FLOW

2 - BAND AROUND DIODE INDICATES CURRENT FLOW

3 - DIODE AS SHOWN IN THE DIAGRAMS

INSTALLATION

(1) Remove the insulation from the wires in the harness. Only remove enough insulation to solder in the new diode.

(2) Install the new diode in the harness, making sure current flow is correct. If necessary, refer to the appropriate wiring diagram for current flow (Fig. 15).

(3) Solder the connection together using rosin core type solder only. **Do not use acid core solder.**

(4) Tape the diode to the harness using electrical tape. Make sure the diode is completely sealed from the elements.

(5) Re-connect the battery and test affected systems.

TERMINAL

REMOVAL

- (1) Disconnect battery.
- (2) Disconnect the connector being repaired from its mating half/component.
- (3) Remove the connector locking wedge, if required (Fig. 16).

Fig. 16 CONNECTOR LOCKING WEDGE TAB (TYPICAL)

- 1 - CONNECTOR
2 - CONNECTOR LOCKING WEDGE TAB

- (4) Position the connector locking finger away from the terminal using the proper pick from special tool kit 6680. Pull on the wire to remove the terminal from the connector (Fig. 17) (Fig. 18).

Fig. 17 TERMINAL REMOVAL

- 1 - CONNECTOR
2 - FROM SPECIAL TOOL KIT 6680

Fig. 18 TERMINAL REMOVAL USING SPECIAL TOOL

- 1 - FROM SPECIAL TOOL KIT 6680
2 - CONNECTOR

- (5) Cut the wire 6 inches from the back of the connector.

INSTALLATION

- (1) Select a wire from the terminal repair assembly that best matches the color wire being repaired.
- (2) Cut the repair wire to the proper length and remove one-half (1/2) inch of insulation.
- (3) Splice the repair wire to the wire harness .
- (4) Insert the repaired wire into the connector.
- (5) Install the connector locking wedge, if required, and reconnect the connector to its mating half/component.
- (6) Re-tape the wire harness starting at 1-1/2 inches behind the connector and 2 inches past the repair.
- (7) Connect battery and test all affected systems.

WIRE

STANDARD PROCEDURE - WIRE SPLICING

When splicing a wire, it is important that the correct gage be used as shown in the wiring diagrams.

- (1) Remove one-half (1/2) inch of insulation from each wire that needs to be spliced.
- (2) Place a piece of adhesive lined heat shrink tubing on one side of the wire. Make sure the tubing will be long enough to cover and seal the entire repair area.
- (3) Place the strands of wire overlapping each other inside of the splice clip (Fig. 19).

Fig. 19 SPLICE CLIP

- (4) Using crimping tool, Miller p/n 8272, crimp the splice clip and wires together (Fig. 20)
- (5) Solder the connection together using rosin core type solder only (Fig. 21).

CAUTION: DO NOT USE ACID CORE SOLDER.

- (6) Center the heat shrink tubing over the joint and heat using a heat gun. Heat the joint until the tubing is tightly sealed and sealant comes out of both ends of the tubing (Fig. 22).

Diode Module	8Wa-50-3, 14, 16	Left Front Park/Turn Signal	
Driver Door Ajar Switch	8Wa-50-2, 3	Lamp No. 1	8Wa-50-9
Engine Starter Motor Relay	8Wa-50-13, 16	Left Front Park/Turn Signal	
Fog Lamp Relay	8Wa-50-16	Lamp No. 2	8Wa-50-9
Fog Lamp Relay		Left Front Position Lamp	8Wa-50-10, 13, 16
No. 1	8Wa-50-4, 9, 10, 13, 14, 15, 17	Left Front Turn Signal Lamp No. 1	8Wa-50-10
Fog Lamp Relay No. 2	8Wa-50-13, 14, 15	Left Front Turn Signal Lamp No. 2	8Wa-50-10
Front Fog Lamp Switch	8Wa-50-13, 14, 15, 16	Left Headlamp	8Wa-50-4, 5, 6, 18
Fuse 3 (JB)	8Wa-50-4, 5, 6, 17	Left Headlamp Leveling Motor	8Wa-50-18
Fuse 4 (JB)	8Wa-50-4, 5, 6, 18	Left Side Marker Lamp	8Wa-50-9
Fuse 5 (JB)	8Wa-50-4, 5, 6, 18	Left Side Repeater Lamp	8Wa-50-10
Fuse 6 (JB)	8Wa-50-2, 3	Power Distribution Center . . .	8Wa-50-2, 3, 7, 8, 13, 14, 15, 16, 17
Fuse 7 (JB)	8Wa-50-9, 10, 13, 15, 16	Right Fog Lamp	8Wa-50-14, 15, 16
Fuse 7 (PDC)	8Wa-50-2, 3, 7, 8, 17	Right Front Park/Turn Signal	
Fuse 8 (PDC)	8Wa-50-3, 8	Lamp No. 1	8Wa-50-11
Fuse 9 (JB)	8Wa-50-7, 8	Right Front Park/Turn Signal	
Fuse 10 (JB)	8Wa-50-17	Lamp No. 2	8Wa-50-11
Fuse 16 (JB)	8Wa-50-4, 5, 6, 17	Right Front Position Lamp	8Wa-50-12
Fuse 19 (PDC)	8Wa-50-2, 3	Right Front Turn Signal Lamp No. 1 . . .	8Wa-50-12
Fuse 23 (JB)	8Wa-50-11, 12	Right Front Turn Signal Lamp No. 2 . . .	8Wa-50-12
Fuse 26 (PDC)	8Wa-50-3	Right Headlamp	8Wa-50-4, 5, 6, 17, 18
G106	8Wa-50-4, 5, 6, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18	Right Headlamp Leveling Motor	8Wa-50-18
G107	8Wa-50-14, 15, 16, 18	Right Side Marker Lamp	8Wa-50-11
G108	8Wa-50-2, 3, 7, 8	Right Side Repeater Lamp	8Wa-50-12
Headlamp Beam Select		Turn Signal/Hazard Switch . . .	8Wa-50-9, 10, 11, 12
Switch	8Wa-50-2, 3, 4, 5, 6, 7, 8, 17, 18	Vehicle Speed Sensor	8Wa-50-17
Headlamp Delay Module	8Wa-50-2, 3, 4, 7, 8		
Headlamp Leveling Switch	8Wa-50-5, 6, 18		
Headlamp Switch	8Wa-50-2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 15, 16

11	Z1 16BK (POWER MIRROR)	GROUND
12	P34 16PK/BK	DOOR UNLOCK DRIVER

LEAK DETECTION PUMP - BLACK 4 WAY

CAV	CIRCUIT	FUNCTION
1	-	-
2	K72 18DG/OR	GENERATOR DRIVER
3	K106 18WT/DG	LEAK DETECTION PUMP SOLENOID CONTROL
4	K105 18WT/OR	LEAK DETECTION PUMP SWITCH SENSE

LEFT BACK-UP LAMP - GRAY 2 WAY

CAV	CIRCUIT	FUNCTION
1	Z1 18BK	GROUND
2	L10 18BR/LG	BACK-UP LAMP FEED

LEFT COURTESY LAMP - BLACK 2 WAY

CAV	CIRCUIT	FUNCTION
1	M1 18PK	FUSED B(+)
2	M2 18BK/WT	COURTESY LAMPS DRIVER

LEFT FOG LAMP - GRAY 2 WAY

CAV	CIRCUIT	FUNCTION
1	Z1 20BK/WT	GROUND
2	L39 20LB	FOG LAMP RELAY OUTPUT

LEFT FRONT DOOR SPEAKER - BLACK 2 WAY

CAV	CIRCUIT	FUNCTION
1	X85 18BK/RD (6 SPEAKER LHD)	AMPLIFIED LEFT FRONT DOOR SPEAKER(-)
1	X55 18LG/RD (4 SPEAKER)	LEFT FRONT SPEAKER(-)
1	X85 18LG/RD (6 SPEAKER RHD)	AMPLIFIED LEFT FRONT DOOR SPEAKER(-)
2	X87 18DG (6 SPEAKER LHD)	AMPLIFIED LEFT FRONT DOOR SPEAKER(+)
2	X53 18LG/BK (4 SPEAKER)	LEFT FRONT SPEAKER(+)
2	X87 18LG/BK (6 SPEAKER RHD)	AMPLIFIED LEFT FRONT DOOR SPEAKER(+)

LEFT FRONT DOOR TWEETER - BLACK 2 WAY		
CAV	CIRCUIT	FUNCTION
1	X85 18LG/RD	AMPLIFIED LEFT FRONT DOOR SPEAKER(-)
2	X87 18LG/BK	AMPLIFIED LEFT FRONT DOOR SPEAKER(+)

LEFT FRONT POSITION LAMP (BUILT UP EXPORT) - 2 WAY		
CAV	CIRCUIT	FUNCTION
1	L77 20BR	FUSED HEADLAMP SWITCH OUTPUT
2	Z1 20BK/WT	GROUND

LEFT FRONT PARK/TURN SIGNAL LAMP NO. 1 (EXCEPT BUILT UP EXPORT) - GRAY		
CAV	CIRCUIT	FUNCTION
1	L61 18LG	LEFT TURN SIGNAL
2	L77 18BR	FUSED HEADLAMP SWITCH OUTPUT
3	Z1 18BK/WT	GROUND

LEFT FRONT PARK/TURN SIGNAL LAMP NO. 2 (EXCEPT BUILT UP EXPORT) - GRAY		
CAV	CIRCUIT	FUNCTION
1	L61 18LG	LEFT TURN SIGNAL
2	L77 18BR	FUSED HEADLAMP SWITCH OUTPUT
3	Z1 18BK/WT	GROUND

LEFT FRONT
TURN SIGNAL
LAMP NO. 1
(BUILT-UP-EXPORT)

LEFT FRONT TURN SIGNAL LAMP NO. 1 (BUILT UP EXPORT) - GRAY 3 WAY

CAV	CIRCUIT	FUNCTION
1	L61 18LG	LEFT TURN SIGNAL
2	-	-
3	Z1 18BK/WT	GROUND

LEFT FRONT
TURN SIGNAL
LAMP NO. 2
(BUILT-UP-EXPORT)

LEFT FRONT TURN SIGNAL LAMP NO. 2 (BUILT UP EXPORT) - GRAY 3 WAY

CAV	CIRCUIT	FUNCTION
1	L61 18LG	LEFT TURN SIGNAL
2	-	-
3	Z1 18BK/WT	GROUND

LEFT FRONT
WHEEL SPEED
SENSOR

LEFT FRONT WHEEL SPEED SENSOR - GRAY 2 WAY

CAV	CIRCUIT	FUNCTION
1	B8 18RD/DB	LEFT FRONT WHEEL SPEED SENSOR (-)
2	B9 18RD	LEFT FRONT WHEEL SPEED SENSOR (+)

LEFT HEADLAMP

LEFT HEADLAMP - 3 WAY

CAV	CIRCUIT	FUNCTION
A	L33 18RD	FUSED LEFT HIGH BEAM OUTPUT
A	L33 20RD (FOG LAMPS)	FUSED LEFT HIGH BEAM OUTPUT
B	L43 18VT	FUSED LEFT LOW BEAM OUTPUT
C	Z1 18BK/WT	GROUND

LEFT HEADLAMP
LEVELING MOTOR
(BUILT-UP-EXPORT)

LEFT HEADLAMP LEVELING MOTOR (BUILT UP EXPORT) - BLACK 3 WAY

CAV	CIRCUIT	FUNCTION
1	L43 18VT	FUSED LEFT LOW BEAM OUTPUT
2	L13 18BR/YL	HEADLAMP ADJUST SIGNAL
3	Z15 18BK/RD	GROUND

LEFT HEATED
SEAT BACK

LEFT HEATED SEAT BACK - 2 WAY		
CAV	CIRCUIT	FUNCTION
A	P88 18BR/BK	LEFT HEATED SEAT BACK DRIVER
B	Z1 18BK	GROUND

LEFT HEATED
SEAT CUSHION

LEFT HEATED SEAT CUSHION - 4 WAY		
CAV	CIRCUIT	FUNCTION
A	P87 18BK/OR	LEFT HEATED SEAT DRIVER
B	P88 18BR/BK	LEFT HEATED SEAT BACK DRIVER
C	P141 18TN/LB	SENSOR FEED
D	P143 18BK/DG	LEFT HEAT SENSE INPUT

LEFT HEATED
SEAT SWITCH

LEFT HEATED SEAT SWITCH - RED 6 WAY		
CAV	CIRCUIT	FUNCTION
1	P137 18VT	LEFT SEAT LOW HEAT LED DRIVER
2	-	-
3	Z1 18BK	GROUND
4	F83 18YL/DG	FUSED IGNITION SWITCH OUTPUT (RUN-ACC)
5	P139 18VT/WT	LEFT SEAT HIGH HEAT LED DRIVER
6	P133 18TN/DG	LEFT SEAT HEATER SWITCH MUX

LEFT LICENSE
LAMP
(BUILT-UP-EXPORT)

LEFT LICENSE LAMP (BUILT UP EXPORT) - 2 WAY		
CAV	CIRCUIT	FUNCTION
1	L78 18BK/YL	FUSED HEADLAMP SWITCH OUTPUT
2	Z1 18BK	GROUND

LEFT POWER
SEAT FRONT
RISER MOTOR

LEFT POWER SEAT FRONT VERTICAL MOTOR - YELLOW 2 WAY		
CAV	CIRCUIT	FUNCTION
1	P19 14YL/LG	LEFT SEAT FRONT UP
2	P21 14RD/LG	LEFT SEAT FRONT DOWN

LEFT POWER
SEAT HORIZONTAL
MOTOR

LEFT POWER SEAT HORIZONTAL MOTOR - YELLOW 2 WAY		
CAV	CIRCUIT	FUNCTION
1	P17 14RD/LB	LEFT SEAT HORIZONTAL REARWARD
2	P15 14YL/LB	LEFT SEAT HORIZONTAL FORWARD

LEFT POWER
SEAT REAR
RISER MOTOR

LEFT POWER SEAT REAR VERTICAL MOTOR - YELLOW 2 WAY		
CAV	CIRCUIT	FUNCTION
1	P13 14RD/WT	LEFT SEAT REAR DOWN
2	P11 14YL/WT	LEFT SEAT REAR UP

LEFT POWER
SEAT SWITCH

LEFT POWER SEAT SWITCH - BLACK 12 WAY		
CAV	CIRCUIT	FUNCTION
A	F37 14RD	FUSED B(+)
B	Z1 14BK	GROUND
C	-	-
E	P13 14RD/WT	LEFT SEAT REAR DOWN
F	-	-
G	-	-
H	-	-
J	P11 14YL/WT	LEFT SEAT REAR UP
K	P17 14RD/LB	LEFT SEAT HORIZONTAL REARWARD
L	P15 14YL/LB	LEFT SEAT HORIZONTAL FORWARD
M	P19 14YL/LG	LEFT SEAT FRONT UP
N	P21 14RD/LG	LEFT SEAT FRONT DOWN

LEFT REAR
DOOR AJAR
SWITCH

LEFT REAR DOOR AJAR SWITCH - BLACK 3 WAY		
CAV	CIRCUIT	FUNCTION
1	-	-
2	Z1 18BK	GROUND
3	M2 18YL	COURTESY LAMPS DRIVER

LEFT REAR
DOOR POWER
LOCK MOTOR

LEFT REAR DOOR POWER LOCK MOTOR - BLACK 2 WAY		
CAV	CIRCUIT	FUNCTION
1	P34 16PK/BK	DOOR UNLOCK DRIVER
2	P33 16OR/BK	DOOR LOCK DRIVER

LEFT REAR
FOG LAMP
(BUILT-UP-EXPORT)

LEFT REAR FOG LAMP (BUILT UP EXPORT) - BLACK 2 WAY		
CAV	CIRCUIT	FUNCTION
1	Z1 18BK	GROUND
2	L38 18OR/WT	REAR FOG LAMP FEED

LEFT REAR
HEADLINER
SPEAKER

LEFT REAR HEADLINER SPEAKER - 2 WAY		
CAV	CIRCUIT	FUNCTION
A	X57 18BR/LB (4 SPEAKER SYSTEM)	LEFT REAR SPEAKER(-)
A	X91 16BR/DB (6 SPEAKER SYSTEM)	AMPLIFIED LEFT REAR SPEAKER(+)
B	X51 18BR/YL (4 SPEAKER SYSTEM)	LEFT REAR SPEAKER(+)
B	X93 16BR/YL	AMPLIFIED LEFT REAR SPEAKER(-)

LEFT REAR
WHEEL SPEED
SENSOR

LEFT REAR WHEEL SPEED SENSOR - BLACK 2 WAY		
CAV	CIRCUIT	FUNCTION
A	B3 20LG/DB	LEFT REAR WHEEL SPEED SENSOR (-)
B	B4 20LG	LEFT REAR WHEEL SPEED SENSOR (+)

LEFT REAR
POWER WINDOW
MOTOR

LEFT REAR POWER WINDOW MOTOR - BLACK 2 WAY		
CAV	CIRCUIT	FUNCTION
1	Q14 14GY	WINDOW LEFT REAR B(+) UP
2	Q24 14DG	LEFT REAR WINDOW DRIVER DOWN

LEFT REAR
POWER WINDOW
SWITCH

LEFT REAR POWER WINDOW SWITCH - BLUE 6 WAY		
CAV	CIRCUIT	FUNCTION
1	Q14 14GY	WINDOW LEFT REAR B(+) UP
2	Q27 14RD/BK	LEFT REAR WINDOW DRIVER DOWN
3	-	-
4	Q17 14DB/WT	LEFT REAR WINDOW DRIVER UP
5	Q24 14DG	LEFT REAR WINDOW DRIVER DOWN
6	Q1 14YL	WINDOW SWITCH FEED

LEFT SIDE
REPEATER
LAMP
(BUILT-UP-EXPORT)

LEFT SIDE REPEATER LAMP (BUILT UP EXPORT) - 2 WAY		
CAV	CIRCUIT	FUNCTION
1	L61 18GY	LEFT TURN SIGNAL
2	Z1 18BK	GROUND

LEFT SIDE
MARKER LAMP
(EXCEPT BUILT
-UP-EXPORT)

LEFT SIDE MARKER LAMP (EXCEPT BUILT UP EXPORT) - NATURAL 2 WAY		
CAV	CIRCUIT	FUNCTION
1	L77 20BR	FUSED LEFT HEADLAMP SWITCH OUTPUT
2	L61 20LG	LEFT TURN SIGNAL

LEFT SPEED
CONTROL
SWITCH

LEFT SPEED CONTROL SWITCH - 2 WAY		
CAV	CIRCUIT	FUNCTION
1	K167 20BR/YL	SENSOR GROUND
2	V37 20RD/LG	SPEED CONTROL SWITCH SIGNAL

LEFT TAIL/
STOP LAMP

LEFT TAIL/STOP LAMP - BLACK 3 WAY		
CAV	CIRCUIT	FUNCTION
1	Z1 18BK	GROUND
2	L77 18BR	FUSED LEFT HEADLAMP SWITCH OUTPUT
3	L50 18WT/TN	PRIMARY BRAKE LAMP SWITCH SIGNAL

LEFT TURN
SIGNAL LAMP

LEFT TURN SIGNAL LAMP - 2 WAY

CAV	CIRCUIT	FUNCTION
1	Z1 18BK	GROUND
2	L63 18DG/RD	LEFT TURN SIGNAL

LEFT VISOR/
VANITY
LAMP

LEFT VISOR/VANITY LAMP - BLACK 2 WAY

CAV	CIRCUIT	FUNCTION
A	M1 20PK	FUSED B(+)
B	Z1 20BK	GROUND

LICENSE LAMP

LICENSE LAMP - 2 WAY

CAV	CIRCUIT	FUNCTION
1	L78 18BK/YL	FUSED HEADLAMP SWITCH OUTPUT
2	Z1 18BK	GROUND

LIFTGATE AJAR
SWITCH

LIFTGATE AJAR SWITCH - BLACK 3 WAY

CAV	CIRCUIT	FUNCTION
1	Z1 18BK	GROUND
2	G78 20TN/BK	LIFTGATE AJAR SWITCH SENSE
3	M4 20VT/YL	LIFTGATE COURTESY LAMP DRIVER

LIFTGATE POWER
LOCK MOTOR

LIFTGATE POWER LOCK MOTOR - BLACK 2 WAY

CAV	CIRCUIT	FUNCTION
A	P33 16OR/BK	DOOR LOCK DRIVER
B	P34 16PK/BK	DOOR UNLOCK DRIVER

LOW COOLANT
SWITCH
(DIESEL)

LOW COOLANT SWITCH (DIESEL) - 2 WAY

CAV	CIRCUIT	FUNCTION
1	G18 18PK/BK	COOLANT LEVEL SWITCH SIGNAL
2	K167 20BR/YL	SENSOR GROUND

MANIFOLD
ABSOLUTE
PRESSURE
SENSOR

MANIFOLD ABSOLUTE PRESSURE SENSOR - BLACK 3 WAY		
CAV	CIRCUIT	FUNCTION
1	K167 20BR/YL	SENSOR GROUND
2	K1 18DG/RD	MANIFOLD ABSOLUTE PRESSURE SENSOR SIGNAL
3	K7 20OR	5V SUPPLY

MESSAGE
CENTER
(DIESEL)

MESSAGE CENTER (DIESEL) - BLACK 8 WAY		
CAV	CIRCUIT	FUNCTION
1	F87 20WT/BK	FUSED IGNITION SWITCH OUTPUT (RUN-START)
2	-	-
3	-	-
4	K185 20OR/LB	WAIT TO START INDICATOR DRIVER
5	-	-
6	-	-
7	G86 20TN/OR	WATER IN FUEL INDICATOR DRIVER
8	G154 20VT/LG	LOW COOLANT INDICATOR DRIVER

NEEDLE
MOVEMENT
SENSOR
(DIESEL)

NEEDLE MOVEMENT SENSOR (DIESEL) - 2 WAY		
CAV	CIRCUIT	FUNCTION
1	K67 18BR/BK	NEEDLE MOVEMENT SENSOR (+)
2	K68 18LG/YL	NEEDLE MOVEMENT SENSOR (-)

OVERHEAD
CONSOLE

OVERHEAD CONSOLE - BLACK 12 WAY		
CAV	CIRCUIT	FUNCTION
1	Z1 20BK	GROUND
2	M1 20PK	FUSED B(+)
3	-	-
4	G31 20VT/LG	AMBIENT TEMPERATURE SENSOR SIGNAL
5	D1 20VT/BR	CCD BUS (+)
6	F87 20WT/BK	FUSED IGNITION SWITCH OUTPUT (RUN-START)
7	M2 20YL	COURTESY LAMPS DRIVER
8	-	-
9	-	-
10	G32 20BK/LB	SENSOR GROUND
11	D2 20WT/BK	CCD BUS(-)
12	Z2 20BK/LG	GROUND

OXYGEN
SENSOR 1/1
UPSTREAM

OXYGEN SENSOR 1/1 UPSTREAM - GRAY 4 WAY		
CAV	CIRCUIT	FUNCTION
1	A42 20DG	FUSED AUTOMATIC SHUTDOWN RELAY OUTPUT
2	Z1 20BK	GROUND
3	K167 20BR/YL	SENSOR GROUND
4	K41 18BK/DG	OXYGEN SENSOR 1/1 SIGNAL

OXYGEN
SENSOR 1/2
DOWNSTREAM

OXYGEN SENSOR 1/2 DOWNSTREAM - BLACK 4 WAY		
CAV	CIRCUIT	FUNCTION
1	A242 20VT/OR	OXYGEN SENSOR RELAY OUTPUT
2	Z1 20BK	GROUND
3	K167 20BR/YL	SENSOR GROUND
4	K141 18TN/WT	OXYGEN SENSOR 1/2 SIGNAL

OXYGEN
SENSOR 2/1
UPSTREAM
(CALIFORNIA/
EUROPEAN III)

OXYGEN SENSOR 2/1 UPSTREAM (CALIFORNIA/EUROPEAN III) - GRAY 4 WAY		
CAV	CIRCUIT	FUNCTION
1	A42 20DG	OXYGEN SENSOR RELAY OUTPUT
2	Z1 20BK	GROUND
3	K167 20BR/YL	SENSOR GROUND
4	K241 18LG/RD	OXYGEN SENSOR 2/1 SIGNAL

OXYGEN
SENSOR 2/2
DOWNSTREAM
(CALIFORNIA/

CONNECTOR/GROUND LOCATIONS

DESCRIPTION 1

**CONNECTOR/GROUND
LOCATIONS****DESCRIPTION**

This section provides illustrations identifying component and connector locations in the vehicle. A con-

nector index is provided. Use the wiring diagrams in each section for connector identification. Refer to the index for the proper figure number. For items that are not shown in this section N/S is placed in the Fig. column.

Connector Name/Number	Color	Location	Fig.
A/C Compressor Clutch (Diesel)	BK	Left Rear of Engine Compartment	35, 36
A/C-Heater Control - C1 or Heater Control - C1	BK	Center of Instrument Panel	13, 14
A/C-Heater Control - C2 or Heater Control - C2	NAT	Center of Instrument Panel	13, 14
A/C High Pressure Switch (LHD)		A/C High Pressure Switch (4.0L)(LHD)	5, 7
A/C High Pressure Switch (RHD)		Left Side of Engine Compartment Near T/O for A/C Compressor Clutch	8
A/C High Pressure Switch (Diesel)		Left Side of Engine	35, 36
A/C Low Pressure Switch (Diesel)(LHD)		Right Rear of Engine Compartment	33
A/C Low Pressure Switch (Diesel)(RHD)		Left Rear of Engine Compartment	28
A/C Low Pressure Switch (Gas)(LHD)		Right Rear of Engine Compartment	5
A/C Low Pressure Switch (Gas)(RHD)		Left Rear of Engine Compartment	5
Accelerator Pedal Position Sensor (Diesel) (LHD)	BK	Near T/O for Engine Control Module - C1, C2	N/S
Accelerator Pedal Position Sensor (Diesel)(RHD)	BK	Right Kick Panel Area	34
Airbag Control Module	YL	Under Center Console	18, 21, 32
Ambient Temperature Sensor	BK	Center Grill Opening	5, 6, 33, 40
Back-Up Lamp Switch (4.0L)	BK	Left Side of Transmission	11
Back-Up Lamp Switch (Diesel)	BK	Left Side of Transmission	37
Battery Temperature Sensor	BK	At Battery	5, 6, 7, 8, 32
Blend Door Actuator	BK	T/O at T/O for C209 on HVAC Harness	N/S
Blower Motor		On HVAC Harness	N/S
Blower Motor Relay	BK	Near T/O for C209	N/S

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
Blower Motor Resistor Block	BK	On HVAC Harness	N/S
Brake Lamp Switch	GY	Near Brake Pedal	12, 15, 16
Brake Warning Pressure Switch (LHD)	BK	Left Side of Engine Compartment	3, 30
Brake Warning Pressure Switch (RHD)	BK	Right Side of Engine Compartment	6, 8, 8, 40
C100 (LHD)	BK	Left Lower Instrument Panel	7, 12, 16
C100 (RHD)	WT	Right Lower Instrument Panel	15, 40
C106	BK	Left Front Engine Compartment	1, 7, 8, 32
C107 (4.0L)	BK	Rear of Engine Compartment	5, 6, 9
C108 (Gas)	BK	Right Side of Engine Compartment	5, 6, 7, 8
C109	BK	Left Lower Instrument Panel	7, 8, 17, 18, 32
C111 (Diesel)	LTGY	Left Rear of Engine Compartment	30, 31, 36
C112 (4.0L A/T 4WD)	GY	Left Side of Transfer Case	11
C113 (Gas M/T)		Rear Center of Engine Compartment	5, 9
C114 (Built-Up-Export)	BK	T/O at Left Headlamp T/O	1
C115 (Built-Up-Export)	BK	T/O at Right Headlamp T/O	N/S
C116 (Diesel)	BK	Right Side of Engine	33, 34, 35
C120 (Diesel)	BK	Rear of Engine	30, 28, 35
C200 (LHD)	GY	Left Lower Instrument Panel	12, 17, 23
C201 (LHD)	NAT	Lower Center of Instrument Panel	12
C202 (RHD)	GY	Lower Center of Instrument Panel	15, 18
C203 (RHD)	BL	Lower Center of Instrument Panel	15, 18
C204 (RHD)	WT	Lower Center of Instrument Panel	15, 18
C205 (LHD)	YL	Left Lower Instrument Panel	12, 13, 21
C205 (RHD)	YL	Right Lower Instrument Panel	14, 15
C206	BK	At Center Console	17, 18, 21, 32
C207	BK	Right Lower Instrument Panel	12, 15
C208	BK	Left Lower Instrument Panel	12, 15
C209 (LHD)	BK	Right Lower Instrument Panel	21, 32
C209 (RHD)	BK	Left Lower Instrument Panel	18
C300 (LHD)	NAT	At Right Kick Panel	21, 32
C300 (RHD)	WT	At Right Kick Panel	15
C301	WT	At Right Kick Panel	15, 21, 23, 32
C303 (Except RHD Full Options)	NAT	T/O at Junction Block - C7 T/O	23
C303 (RHD Full Options)	WT	T/O at Junction Block - C7 T/O	23
C304	BK	Right Lower B Pillar	22
C305	WT	At Left Kick Panel	17, 18
C306	WT	At Left Kick Panel	17, 18
C307	WT	At Left Kick Panel	17, 18

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
C309	BK	Left Lower B Pillar	17, 18
C310	BK	Top Center of Liftgate	25
C311	BK	Top Center of Liftgate	25
C312	GN	Top Center of Liftgate	25
C313	GY	Top Center of Liftgate	25
C314	WT	At Soundbar	N/S
C316	BK	Under Right Front Seat	17, 18, 22
C317	BK	Left Lower A Pillar	17, 18
C318	BK	Right Lower A Pillar	22
C319	BK	Right Lower B Pillar	22
C320	BK	Left Lower B Pillar	17, 18
C321	BK	At Right Tail Lamp Harness	N/S
C322 (Trailer Tow)	BK	At Left Tail Lamp Harness	27
C322 (Without Trailer Tow)	BK	At Left Tail Lamp Harness	19
C323 (Trailer Tow)	BK	At Trailer Tow Harness	19, 27
C324 (RHD)	WT	In T/O for Junction Block - C7	N/S
C326	BK	At Left Rear Quarter Panel	19, 20
C327	BK	At Left Rear Quarter Panel	19, 20
C329	NAT	Under Right Front Seat	17, 18
C330	BK	Center of Liftgate	25
C332	NAT	Under Left Front Seat	17, 18
C333	BK	At Center High Mounted Stop Lamp Jumper	N/S
C362	BK	Under Left Front Seat	17, 18
C363	BK	Under Right Front Seat	17, 18
Camshaft Position Sensor (GAS)	GY	Right Side of Engine	9
Cargo Lamp/Switch	BK	At Lamp	N/S
Center High Mounted Stop Lamp	BK	At Liftgate	N/S
Cigar Lighter	RD	Lower Center of Instrument Panel	13, 14
Clockspring - C1	NAT	At Clockspring	29
Clockspring - C2		At Clockspring	N/S
Clockspring - C3	YL	At Clockspring	29
Clutch Interlock Switch	GN	At Clutch Pedal	7, 15, 16
Clutch Interlock Switch Jumper (LHD)	BK	Lower Steering Column	N/S
Clutch Interlock Switch Jumper (RHD)	BK	Lower Steering Column	15
Combination Flasher	BK	Lower Left of Instrument Panel	12
Controller Anti-Lock Brake	BK	Left Side of Engine Compartment	3, 30, 37
Crankshaft Position Sensor (Gas)	BK	Left Side of Transmission	11
Data Link Connector (LHD)	BK	Lower Left of Instrument Panel	12
Data Link Connector (RHD)	BK	Lower Right of Instrument Panel	N/S
Daytime Running Lamp Module (Except Built-Up-Export)	BK	Right Rear of Engine Compartment	7

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
Diode Module (Built-Up-Export)	BK	T/O at Rear Fog Lamp Relay T/O	N/S
Dome Lamp (Base/Police)		At Lamp	N/S
Dome Lamps Switch (Midline)	BK	At Switch	N/S
Driver Door Ajar Switch	BK	Left Lower A Pillar	N/S
Driver Door Lock Motor		At Motor	24
Driver Door Module C1	BL	At Switch	24
Driver Door Module C2	WT	At Switch	24
Driver Power Mirror	RD	At Mirror	24
Driver Power Window Motor	BK	At Motor	24
Duty Cycle EVAP/Purge Solenoid (Gas) (LHD)	BK	Right Rear of Engine Compartment	3, 5
Duty Cycle EVAP/Purge Solenoid (Gas) (RHD)	BK	Left Rear of Engine Compartment	4
EGR Solenoid (Diesel)		Right Front of Engine Compartment	33, 34
Engine Control Module - C1 (Diesel)	BK	Center of Cowl Under Instrument Panel	32
Engine Control Module - C2 (Diesel)	BK	Center of Cowl Under Instrument Panel	32
Engine Coolant Temperature Sensor (GAS)	BK	Front of Engine	9
Engine Coolant Temperature Sensor NO.1 (Diesel)	BK	Left Rear of Engine	35
Engine Coolant Temperature Sensor NO.2 (Diesel)	BK	Left Side of Engine	35, 36
Engine Oil Pressure Sensor	BK	Right Side of Engine	9, 35
Engine Speed Sensor (Diesel)	BK	Left Side of Engine	35
EVAP Leak Detection Pump (Except Built-Up-Export)	BK	In T/O for Power Distribution Center	N/S
Extended Idle Switch (Police Package)	WT	Instrument Panel Harness Near T/O to Power Outlet	N/S
Front Fog Lamp Switch	BK	Lower Center of Instrument Panel	13, 14
Front Wiper Motor	BK	At Wiper Motor	2
Fuel Heater (Diesel)		Left Rear of Engine Compartment	30, 28
Fuel Injection Pump (Diesel)	BK	Left Side of Engine	30, 28, 42
Fuel Injector No. 1	BK	At Injector	9
Fuel Injector No. 2	BK	At Injector	9
Fuel Injector No. 3	BK	At Injector	9
Fuel Injector No. 4	BK	At Injector	9
Fuel Injector No. 5 (4.0L)	BK	At Injector	9
Fuel Injector No. 6 (4.0L)	BK	At Injector	9
Fuel Level Sensor (Diesel)	BK	At Sensor	19
Fuel Pump Module (GAS)	BK	At Fuel Pump Module	19
G100 (4.0L)		Right Front of Engine Compartment	5, 6
G101		Right Side of Engine	9

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
G102 (Diesel)		Right Side of Engine	33, 34
G102 (Gas)		Rear of Engine Compartment	5, 6
G104 (Gas)		T/O at Engine Starter Motor T/O on Battery Harness	N/S
G104 (Diesel)		T/O at Battery Negative Terminal on Battery Harness	N/S
G105 (Diesel)		On Negative Battery Harness	N/S
G106		Left Side of Engine Compartment	3
G107 (LHD)		Right Side of Instrument Panel	12
G107 (RHD)		Left Side of Instrument Panel	15
G108 (LHD)		Left Side of Instrument Panel	12
G108 (RHD)		Right Side of Instrument Panel	15
G200		Under Left Front Seat	18, 21, 32
G300		In T/O for Airbag Control Module	N/S
G301		Near T/O for Power Amplifier	19
G302		At Left Rear Quarter Panel	19
G303		Under Right Front Seat	17, 18, 22
G304		T/O at T/O's for C326 and C327	20
G306		Under Right Front Seat	17, 18
G Switch	BK	Under Rear Seat	19, 22
Generator (4.0L)	BK	At Generator	10
Generator (Diesel)	BK	At Generator	41, 42
Glow Plug Relay (Diesel)		Left Rear of Engine Compartment	30, 28
Headlamp Beam Select Switch	BK	On Steering Column	29
HeadLamp Delay Module (LHD)	BK	Lower Left of Instrument Panel	12
Headlamp Delay Module (RHD)	BK	Lower Right of Instrument Panel	N/S
Headlamp Leveling Switch (Built-Up-Export)	BK	Lower Center of Instrument Panel	13, 14
Headlamp Switch (LHD)	BK	Left Side of Instrument Panel	13, 23
Headlamp Switch (RHD)	BK	Right Side of Instrument Panel	14
Heated Seat Relay		Under Right Front Seat	N/S
Idle Air Control Motor	BK	Left Side of Engine	9
Ignition Switch - C1	BK	At Steering Column	12, 15, 29
Ignition Switch - C2	GN	At Steering Column	12, 15, 29
Instrument Cluster - C1	BK	At Instrument Cluster	12, 13, 14, 15
Instrument Cluster - C2	BK	At Instrument Cluster	12, 13, 14, 15
Intake Air Temperature Sensor	GY	Left Side of Engine	9
Junction Block - C1	NAT	At Right Kick Panel Area	16, 22
Junction Block - C2	WT	At Right Kick Panel Area	16, 22
Junction Block - C3	NAT	At Right Kick Panel Area	22
Junction Block - C4	WT	At Right Kick Panel Area	15, 22, 23

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
Junction Block - C5	WT	At Right Kick Panel Area	15, 22, 23
Junction Block - C6	NAT	At Right Kick Panel Area	22
Junction Block - C7	NAT	At Right Kick Panel Area	22
Junction Block - C8	NAT	At Right Kick Panel Area	22
Junction Block - C9	NAT	At Right Kick Panel Area	22
Left Back-Up Lamp	GY	At Lamp	N/S
Left City Lamp (Built-Up-Export)		At Lamp	1
Left Courtesy Lamp	BK	Lower Left of Instrument Panel	12, 15
Left Fog Lamp	GY	At Lamp	1
Left Front Door Speaker	BK	At Speaker	24
Left Front Door Tweeter	BK	Left Front Door	24
Left Front Park/Turn Signal Lamp NO.1 (Except Built-Up-Export)	GY	At Lamp	1
Left Front Park/Turn Signal Lamp NO.2 (Except Built-Up-Export)	GY	At Lamp	1
Left Front Turn Signal Lamp NO.1 (Built-Up-Export)	GY	At Lamp	1
Left Front Turn Signal Lamp NO.2 (Built-Up-Export)	GY	At Lamp	1
Left Front Wheel Speed Sensor	GY	Left Side of Engine Compartment	3, 32
Left Headlamp		At Headlamp	1
Left Headlamp Leveling Motor (Built-Up-Export)	BK	At Headlamp	1
Left Heated Seat Back		At Left Seat	N/S
Left Heated Seat Cushion		At Left Seat	N/S
Left Heated Seat Switch	RD	At Center Console	17, 18
Left License Lamp (Built-Up-Export)		At Lamp	N/S
Left Power Seat Front Vertical Motor	YL	Under Left Seat	N/S
Left Power Seat Horizontal Motor	YL	Under Left Seat	N/S
Left Power Seat Rear Vertical Motor	YL	Under Left Seat	N/S
Left Power Seat Switch	BK	At Switch	N/S
Left Rear Door Ajar Switch	BK	At Left B Pillar	N/S
Left Rear Door Lock Motor	BK	In Left Rear Door	24
Left Rear Fog Lamp (Built-Up-Export)	BK	At Lamp	N/S
Left Rear Wheel Speed Sensor	BK	Under Rear Seat	19
Left Rear Window Motor	BK	In Left Rear Door	24
Left Rear Window Switch	BL	In Left Rear Door	24
Left Repeater Lamp (Built-Up-Export)		At Lamp	1
Left Side Marker Lamp (Except Built-Up-Export)	NAT	At Lamp	1

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
Left Soundbar Speaker		At Soundbar	N/S
Left Speed Control Switch		On Steering Wheel	N/S
Left Tail/Stop Lamp	BK	At Lamp	N/S
Left Turn Signal Lamp		At Rear Lamp	N/S
Left Visor/Vanity Lamp	BK	Left Side of Headliner	28
License Lamp		At Lamp	N/S
Liftgate Lock Motor	BK	In Liftgate	25
Liftgate Ajar Switch	BK	In Liftgate	25
Low Coolant Switch (Diesel)		Right Side of Engine Compartment	33, 34
Manifold Absolute Pressure Sensor	BK	Left Side of Engine	9
Overhead Console	BK	At Front Headliner	N/S
Message Center (Diesel)	BK	Upper Center of Instrument Panel	12, 13, 14, 15
Needle Movement sensor (Diesel)		Rear of Engine Compartment	30, 28
Overhead Console	BK	Front Headliner	N/S
Oxygen Sensor 1/1 Upstream (4.0L)	GY	Right Side of Transmission	11
Oxygen Sensor 1/1 Upstream (California/European III)	GY	Left Side of Engine	9
Oxygen Sensor 1/2 Downstream (4.0L)	BK	Right Side of Transmission	11
Oxygen Sensor 1/2 Downstream (California/European III)	BK	Left Side of Engine	9
Oxygen Sensor 2/1 Upstream (California/European III)	GY	Left Side of Engine	9
Oxygen Sensor 2/2 Downstream (California/European III)	BK	Left Side of Engine	11
Passenger Airbag	YL	At Airbag	12, 13, 14, 15
Passenger Door Ajar Switch	BK	Kick Panel Area at Door Opening	22
Passenger Door Lock Motor		At Motor	24
Passenger Door Module C1	BL	At Switch	24
Passenger Door Module C2	BL	At Switch	24
Passenger Power Mirror	RD	At Mirror	24
Passenger Power Window Motor	BK	At Motor	24
Power Amplifier - C1	NAT	Under Left Rear Seat	19
Power Amplifier - C2	NAT	Under Left Rear Seat	19
Power Antenna (Built-Up-Export)	BK	Right Side of Instrument Panel	12, 15
Power Antenna Relay - C1 (Built-Up-Export)	BK	Right Side of Instrument Panel	12, 15
Power Antenna Relay - C2 (Built-Up-Export)	BK	Right Side of Instrument Panel	12, 15
Power Mirror Switch		At Switch	N/S
Power Outlet	RD	Lower Center of Instrument Panel	13, 14

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
Powertrain Control Module - C1 (Diesel)		Right Side of Engine Compartment	33, 34
Powertrain Control Module - C1 (Gas)	BK	Left Side of Engine Compartment	2, 9
Powertrain Control Module - C2 (Diesel)		Right Side of Engine Compartment	33, 34
Powertrain Control Module - C2 (Gas)	WT	Left Side of Engine Compartment	2, 9
Powertrain Control Module - C3 (Diesel)	GY	Right Side of Engine Compartment	33, 34
Powertrain Control Module - C3 (Gas)	GY	Left Side of Engine Compartment	2, 3
Radiator Fan Motor	LT GY	Front of Engine Compartment	3, 7, 8, 30, 30, 28, 32
Radio - C1	BK	Center of Instrument Panel	13, 14
Radio - C2	GY	Center of Instrument Panel	13, 14
Rail Coil (4.0L)	BK	Right Side of Engine	9
Rear Fog Lamp Relay (Built-Up-Export) (LHD)		Right Side of Instrument Panel	12
Rear Fog Lamp Relay (Built-Up-Export) (RHD)		Left Side of Instrument Panel	15
Rear Fog Lamp Switch (Built-Up-Export)	WT	Center of Instrument Panel	13, 14
Rear Washer Pump	BK	Left Front of Engine Compartment	2, 3, 30, 28
Rear Window Defogger Switch	GY	Center of Instrument Panel	13, 14
Rear Wiper Motor		In Liftgate	25
Rear Wiper/Washer Switch	BK	Center of Instrument Panel	13, 14
Remote Keyless Entry Module	BK	Front Center of Headliner	28
Right Back-Up Lamp	GY	At Lamp	N/S
Right City Lamp (Built-Up-Export)		At Lamp	1
Right Courtesy Lamp	BK	Lower Right of Instrument Panel	12, 15
Right Fog Lamp	GY	At Lamp	1
Right Front Door Speaker	BK	At Speaker	24
Right Front Door Tweeter	BK	At Right Front Door	24
Right Front Park/Turn Signal Lamp NO.1 (Except Built-Up-Export)	BK	At Lamp	1
Right Front Park/Turn Signal lamp NO.2 (Except Built-Up-Export)	BK	At Lamp	1
Right Front Turn Signal Lamp NO.1 (Built-Up-Export)	GY	At Lamp	1
Right Front Turn Signal Lamp NO.2 (Built-Up-Export)	GY	At Lamp	1
Right Front Wheel Speed Sensor		Right Side of Engine Compartment	5, 33, 40, 34
Right Headlamp		At Headlamp	1

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
Right Headlamp Leveling Motor (Built-Up-Export)	BK	At Headlamp	1
Right Heated Seat Back		At Right Seat	N/S
Right Heated Seat Cushion		At Right Seat	N/S
Right Heated Seat Switch	BL	At Center Console	17, 18
Right License Lamp (Built-Up-Export)		At Lamp	N/S
Right Power Seat Front Vertical Motor	YL	Under Right Seat	N/S
Right Power Seat Horizontal Motor	YL	Under Right Seat	N/S
Right Power Seat Rear Vertical Motor	YL	Under Right Seat	N/S
Right Power Seat Switch	BK	At Switch	N/S
Right Rear Door Ajar Switch	BK	At Right B Pillar	22
Right Rear Door Lock Motor	BK	In Right Rear Door	24
Right Rear Fog Lamp (Built-Up-Export)	BK	At Lamp	N/S
Right Rear Wheel Speed Sensor	RD	Under Rear Seat	19
Right Rear Window Motor	BK	In Right Rear Door	24
Right Rear Window Switch	BL	In Right Rear Door	24
Right Repeater Lamp (Built-Up-Export)		At Lamp	N/S
Right Side Marker Lamp (Except Built-Up-Export)	NAT	At Lamp	1
Right Sound Bar Speaker		At Soundbar	N/S
Right Speed Control Switch		On Steering Wheel	N/S
Right Tail/Stop Lamp		At Lamp	N/S
Right Turn Signal Lamp		At Rear Lamp	N/S
Right Visor/Vanity Lamp	BK	Right Side of Headliner	28
Seat Belt Switch (LHD)	BK	T/O at T/O for Airbag Control Module	21, 32
Seat Belt Switch (RHD)	BK	T/O at T/O for C206	N/S
Seat Heat Interface Module	BK	Under Right Front Seat	N/S
Sentry Key Immobilizer Module	BK	At Steering Column	12, 15
Shift Lock Solenoid (LHD)	WT	At Steering Column	12, 29
Shift Lock Solenoid (RHD)	WT	At Steering Column	29
Throttle Position Sensor	WT	Left Side of Engine	9
Trailer Tow Connector	LT GY	At Rear Bumper	27
Trailer Tow Left Turn Relay	BK	At Left Rear Quarter Panel	27
Trailer Tow Right Turn Relay	BK	At Left Rear Quarter Panel	27
Transfer Case Switch (231 4WD)	BK	Left Side of Transmission	11, 37
Transfer Case Switch (242 4WD)	BK	Left Side of Transmission	11
Transfer Case Switch Illumination	BK	At Center Console	17, 18

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
Transmission Control Assembly or Transmission Solenoid (4.0L)	BK	Rear of Engine Compartment	5, 6
Transmission Control Module (4.0L)	BK	Under Instrument Panel near Transmission Tunnel	7, 7, 8, 16
Transmission Range Indicator Illumination (PRNDL)		At Center Console	17, 18
Transmission Range Sensor (4.0L A/T)	BK/GY	Rear of Engine Compartment	5, 6
Turbo Boost Pressure Sensor (Diesel)	BK	Rear of Engine Compartment	30, 31
Turn Signal/Hazard Switch	BK	At Steering Column	12, 15, 29
Underhood Lamp/Switch	BK	At Lamp	3, 30, 28
Vehicle Speed Control Servo (LHD)	BK	Right Front of Engine Compartment	5, 7
Vehicle Speed Control Servo (RHD)	BK	Right Rear of Engine Compartment	2, 6, 8
Vehicle Speed Sensor (Diesel)		Left Side of Transmission	43, 37
Vehicle Speed Sensor (Gas)	BK	Left Side of Transmission	11
Washer Fluid Level Switch	BK	Left Front of Engine Compartment	2, 3, 30, 28
Water In Fuel Sensor (Diesel)	BK	Rear of Engine Compartment	30, 28
Windshield Washer Pump	BK	Left Front of Engine Compartment	2, 3, 30, 31
Wipe/Wash Switch	NAT	At Steering Column	12, 15, 29

SPLICE LOCATIONS

DESCRIPTION 1

SPLICE LOCATIONS**DESCRIPTION**

This section provides illustrations identifying the general location of the splices on this vehicle. A splice

index is provided. Use the wiring diagrams in each section for splice number identification. Refer to the index for proper splice number. For splices that are not shown in the figures in this section, a N/S is placed in the Fig. column.

Splice Number	Location	Fig.
S100	Near T/O for Right Headlamp	9
S101	Near T/O for Right Headlamp	9
S102	Near T/O for Right Headlamp	9
S103	Near T/O for Left Headlamp	9
S104	Near T/O for Left Headlamp	9
S105	Near T/O for Left Headlamp	9
S106	Near T/O for Left Headlamp	9
S107	Near T/O for Fuel Injector NO. 6	10
S108	Near T/O for Ignition Coil Pack	10
S108 (California)	Near Fuel Injector T/O's	10
S109	Near Fuel Injector T/O's	10
S111	Near Fuel Injector T/O's	10
S112	Near Fuel Injector T/O's	10
S113	Between Fuel Injector NO. 3 and Fuel Injector NO. 4 T/O's	10
S114	Between Fuel Injector NO. 2 and Fuel Injector NO. 3 T/O's	10
S115	Near T/O for Idle Air Control Motor	10
S118	In T/O for Generator Output Terminal	N/S
S119	Near Fuel Injector T/O's	10
S121	Near Fuel Injector T/O's	10
S122	Near T/O for Ignition Coil Pack	10
S123	Near T/O for Powertrain Control Module - C2	N/S
S130 (LHD) (Diesel)	Near T/O for Left Front Wheel Speed Sensor	5
S130 (RHD) (Diesel)	Near T/O for Glow Plug Relay	6
S130 (Gas)	Near T/O for junction Block - C2	3, 4
S131 (Gas)	Near Grommet T/O for Junction Block - C2	3, 4
S131 (Diesel)	Near T/O for Underhood Lamp	5
S132 (LHD)	Near T/O for A/C Low Pressure Switch	3

SPLICE LOCATIONS (Continued)

Splice Number	Location	Fig.
S132 (LHD) (M/T ABS)	Near T/O for Underhood Lamp	3
S132 (RHD)	Near Grommet T/O for C100	4
S133	Near Grommet T/O for Junction Block - C2 or A/C Low Pressure Switch	3
S133 (LHD) (Gas)	Near Grommet T/O for Front Wiper Motor	1
S133 (LHD) (Diesel)	Near T/O for C111	5
S133 (RHD) (Gas)	Near T/O for A/C Low Pressure Switch	2
S133 (RHD) (Diesel)	Near T/O for Bulkhead Grommet	6
S134 (LHD)	Near T/O for Underhood Lamp or C107	3
S134 (RHD) (ABS)	Near T/O for Transmission Control Module	2
S135 (LHD)	Near T/O for C107	3
S135 (LHD) (M/T ABS)	Near T/O for Right Front Wheel Speed Sensor	3
S135 (RHD)	Near T/O for Underhood Lamp	4
S136	Near T/O for C107	3
S137 (LHD) (Diesel)	Near T/O for Glow Plug Relay	5
S137 (RHD) (Diesel)	Near T/O for Glow Plug Relay	6
S138 (Gas)	Near T/O for Transmission Control Module or C107	1, 2
S138 (LHD) (Diesel)	Near T/O for Underhood Lamp	5
S138 (RHD) (Diesel)	Near T/O for Glow Plug	6
S139 (LHD) (A/T)	Near T/O for Brake Warning Pressure Switch	1
S139 (LHD) (Diesel)	Near T/O for Glow Plug	5
S139 (LHD)(M/T ABS)	Near Grommet T/O for C100	1
S139 (RHD) (Diesel)	Near T/O for C111	6
S139 (RHD) (Gas)	Near T/O for A/C Low Pressure Switch	2
S140	Near T/O for Transmission Control Module	1, 2
S141 (LHD)	Near Grommet T/O for Front Wiper Motor	1
S141 (RHD)	Near T/O for C107	2
S142 (LHD)	Near Grommet T/O for Front Wiper Motor	1
S142 (RHD)	Near Grommet T/O for Transmission Control Module	4
S143 (LHD)	Near Grommet T/O for C100	1
S143 (RHD)	Near T/O for C107	4
S144 (LHD)	Near Grommet T/O for C100	1

SPLICE LOCATIONS (Continued)

Splice Number	Location	Fig.
S144 (RHD)	Near T/O for G106	2
S144 (RHD) (ABS)	Near T/O for A/C Low Pressure Switch	2
S145 (LHD)	Near Grommet T/O for C100	1
S145 (RHD)	Near T/O for G106	2
S145 (RHD) (ABS)	Near T/O for A/C Low Pressure Switch	2
S147 (LHD) (Diesel)	Near T/O for C111	5
S147 (RHD) (Diesel)	Near T/O for Glow Plug Relay	6
S148 (LHD) (Diesel)	Near T/O for Glow Plug	5
S148 (RHD) (Diesel)	Near T/O for C111	6
S149 (LHD) (Diesel)	Near T/O for C120	5
S149 (RHD) (Diesel)	Near T/O for C111	6
S151 (LHD) (Diesel)	Near T/O for Left Front Wheel Speed Sensor	5
S151 (RHD) (Diesel)	Near T/O for PDC	6
S152 (LHD) (Diesel)	Near T/O for Glow Plug	5
S152 (RHD) (Diesel)	Near T/O for C111	6
S153 (LHD) (Diesel)	In T/O for PDC	5
S153 (RHD) (Diesel)	In T/O for PDC	6
S156 (LHD) (Diesel)	Near T/O for Underhood Lamp	5
S156 (RHD) (Diesel)	Near T/O for Glow Plug	6
S157 (LHD) (Diesel)	Near T/O for Glow Plug Relay	5
S157 (RHD) (Diesel)	Near T/O for Glow Plug Relay	6
S159	Near Grommet T/O for Junction Block - C2	3, 4
S162	Near T/O for Left Headlamp Leveling Motor	8
S163	Near T/O for Right Headlamp Leveling Motor	8
S166	Near T/O for Power Distribution Center	3
S169 (LHD) (Diesel)	Near T/O for C111	5
S170	Near T/O for C120	7

SPLICE LOCATIONS (Continued)

Splice Number	Location	Fig.
S201 (LHD)	Near T/O for C200	12
S201 (RHD)	Near T/O for Data Link Connector	13
S203	In T/O for Brake Lamp Switch	13
S204 (LHD)	In T/O for Brake Lamp Switch	12
S204 (RHD)	Near T/O for Shift Lock Solenoid	13
S205 (LHD)	In T/O for C100	12
S205 (RHD)	Near T/O for C202, C203 and C204	13
S206	In Lower Instrument Panel Trough	12, 13
S207	In Lower Instrument Panel Trough	12, 13
S208 (LHD)	In Lower Instrument Panel Trough	12
S208 (RHD)	Near T/O for C202	13
S209	In Lower Instrument Panel Trough	12, 13
S210	In Lower Instrument Panel Trough	12, 13
S211	In Lower Instrument Panel Trough	12, 13
S212 (RHD)	In Lower Instrument Panel Trough	13
S213 (RHD)	Near T/O to Turn Signal/Hazard Switch	13
S214 (LHD)	Near T/O for Diode Module, Rear Fog Lamp Relay and G107	11
S214 (RHD)	Near T/O for Instrument Cluster - C1	13
S215 (LHD)	Near T/O for Cigar Lighter	12
S215 (RHD)	Near T/O for A/C-Heater Control - C2	13
S216 (LHD)	Near T/O for Instrument Cluster - C2	12
S216 (RHD)	Near T/O for Junction Block -C4 and C5	13
S217	In T/O for A/C Heater Control C2	N/S
S218 (LHD)	In T/O for Headlamp Switch	N/S
S218 (RHD)	In T/O for C100	13
S219 (LHD)	In T/O for C209	14
S219 (RHD)	Near T/O for Junction Block - C4 and C5	13
S220	Near T/O for Cigar Lighter	13
S221	Near T/O for Clockspring - C2	N/S
S222	Near T/O for Clockspring - C2	N/S
S225	In T/O for C301	14
S226 (LHD)	In T/O for Headlamp Switch	N/S
S226 (RHD)	In T/O for Headlamp Switch	13
S227	Near T/O for Headlamp Switch	12, 13
S228	Near T/O for Blower Motor Resistor Block	N/S
S229 (LHD)	Near T/O for Rear Fog Lamp Relay	11
S229 (RHD)	Near T/O for A/C Heater Control C2	13
S230	Near T/O for Cigar Lighter	13
S232	Near T/O for Junction Block - C4 and C5	13
S237	Near T/O for Rear Fog Lamp Relay	11
S238	In T/O for Combination Flasher	12, 13
S239	In T/O for Combination Flasher	12, 13

SPLICE LOCATIONS (Continued)

Splice Number	Location	Fig.
S301	In T/O for Power Amplifier	15
S302	Near T/O for Fuel Pump Module	15

TRANSMISSION/TRANSAXLE

DESCRIPTION

This Service Manual Supplement includes ONLY the information that is new or updated for 2001 Model Year. All other Service Manual

information is in the 2000 Model Year Service Manual.

When you are using this information you may be referred to another section of the Service Manual. The refer to is written differently than in prior years.

MANUAL NV 3550

	page		page
MANUAL NV 3550		INSTALLATION	36
DISASSEMBLY	1	VEHICLE SPEED SENSOR	
ASSEMBLY	14	DESCRIPTION	36
EXTENSION HOUSING BUSHING		OPERATION	36
REMOVAL	35	REMOVAL	37
INSTALLATION	35	INSTALLATION	37
EXTENSION HOUSING SEAL 2WD			
REMOVAL	36		

MANUAL NV 3550

DISASSEMBLY

FRONT HOUSING

- (1) Shift transmission into Neutral.
- (2) Remove drain plug and drain lubricant.
- (3) Inspect drain plug magnet for debris.
- (4) Remove backup light switch. Switch is located on passenger side of rear housing (Fig. 1).
- (5) Remove shift tower bolts and remove tower and lever assembly (Fig. 2).
- (6) Remove shift shaft lock bolt (Fig. 3) located on top of the housing just forward of shift tower.

SHIFT/FORK SHAFTS AND REVERSE IDLER SEGMENT

(1) Unseat the roll pin that secures the shift socket to the shift shaft with Remover 6858 as follows:

(a) Position remover on the shift shaft. Center the tool over the roll pin and verify that the tool legs are firmly seated on the shift socket (Fig. 15).

(b) Tilt the socket toward the side of the case. This positions the roll pin at a slight angle to avoid trapping the pin between the gear teeth.

(c) Tighten the tool to press the roll pin downward and out of the shift socket (Fig. 15).

NOTE: Press the roll pin just enough to clear the shift shaft. Be careful not to push the pin into the geartrain.

J9521-198

Fig. 15 SHIFT SOCKET ROLL PIN

- 1 - SPECIAL TOOL 6858
- 2 - SHIFT SOCKET

(2) With a hammer and punch drive out roll pin that secures shift bushing and lever to shift shaft (Fig. 16).

NOTE: Use proper size punch to avoid bending the shift shaft.

MANUAL NV 3550 (Continued)

Fig. 16 SHIFT SHAFT LEVER AND BUSHING ROLL PIN

MANUAL NV 3550 (Continued)

(7) Remove the reverse idler shaft support bolt (front bolt) (Fig. 21).

(8) Loosen rear reverse idler shaft bolt (rear bolt) (Fig. 21).

80ba7a73

Fig. 21 REVERSE IDLER SHAFT/SUPPORT BOLT

- 1 - SUPPORT BOLT
2 - SHAFT BOLT

(9) Remove reverse idler shaft support (Fig. 22) segment by sliding it straight out of housing.

80a2acb4

Fig. 22 IDLER SHAFT SUPPORT

- 1 - IDLER SHAFT
2 - IDLER SHAFT SUPPORT

(10) Support geartrain and rear housing on Fixture 6747 as follows:

(a) Adjust height of reverse idler pedestal rod until the reverse idle shaft bottoms in Cup 8115.

(b) Position Adapters 6747-1A and 6747-2B on Fixture 6747.

(c) Slide fixture tool onto input shaft, countershaft and idler gear (Fig. 23).

(d) Stand geartrain and rear housing upright on fixture (Fig. 24). Have helper hold fixture tool in place while housing and geartrain is being rotated into upright position.

80a9b3b4

Fig. 23 FIXTURE ASSEMBLY

MANUAL NV 3550 (Continued)

(11) Remove rear bolt holding reverse idler shaft in housing.

REAR HOUSING - 2WD

(1) On 2-wheel drive transmission, remove three bolts that attach output shaft bearing retainer to rear case (Fig. 25). Bolts are rear of shift tower opening.

J9421-50

Fig. 25 OUTPUT SHAFT

1 - OUTPUT SHAFT BEARING RETAINER BOLTS (THIRD BOLT IS AT OPPOSITE SIDE OF CASE)

(2) Unseat output shaft bearing from bearing bore in rear housing. Use plastic/rawhide mallet to tap rear housing upward and off output shaft bearing as shown (Fig. 26).

(3) Lift rear housing up and off geartrain (Fig. 27).

(4) Remove countershaft rear bearing from countershaft (Fig. 28).

J9421-49

Fig. 26 REAR HOUSING - 2WD

1 - REAR HOUSING
2 - PLASTIC/RAWHIDE MALLET
3 - FIXTURE

(5) Examine condition of bearing bore and idler shaft notch in rear housing. Replace housing if any of these components are damaged.

REAR ADAPTER HOUSING - 4WD

(1) Locate rear seal dimples (Fig. 29). With slide hammer mounted screw, remove rear seal by inserting screw into one of the seal dimples (Fig. 30).

MANUAL NV 3550 (Continued)

**Fig. 32 REAR ADAPTER HOUSING**

- 1 - REAR ADAPTER HOUSING
- 2 - OUTPUT SHAFT

(4) Remove bearing retainer bolts and remove rear bearing retainer and rear bearing (Fig. 33). If needed push or tap bearing out of the housing with a hammer.

(5) Examine condition of bearing bore, countershaft rear bearing race and idler shaft notch in rear housing. Replace housing if race, bore or notch are worn or damaged.

GEARTRAIN FROM FIXTURE

(1) Remove reverse idler gear assembly from assembly fixture cup.

(2) Remove 1-2 and fifth-reverse forks from synchro sleeves.

(3) Slide countershaft out of fixture tool.

(4) Remove output shaft bearing retainer from rear surface of fifth gear (retainer will drop onto gear after bolts are removed).

(5) Lift and remove output shaft and gears off input shaft.

(6) Lift and remove input shaft, pilot bearing and fourth gear synchro ring from assembly fixture tool.

OUTPUT SHAFT

NOTE: The synchronizer hubs and sleeves are different and must not be intermixed. Remove each synchronizer unit as an assembly to avoid intermixing parts. Reference mark or tag each synchro hub and sleeve for correct assembly.

MANUAL NV 3550 (Continued)

(1) Remove snap ring that secures 3-4 synchro hub on output shaft.

(2) Remove 3-4 synchro assembly, third gear synchro ring and third gear with shop press and Bearing Splitter 1130. Position splitter between second and third gears.

(3) Remove third gear needle bearing (Fig. 34).

80a9b3b7

Fig. 34 THIRD GEAR NEEDLE BEARING

1 - THIRD GEAR NEEDLE BEARING

(4) Remove retaining ring that secures two-piece thrust washer on shaft (Fig. 35). Use a small pry tool to remove retaining ring.

ASSEMBLY

Sealers are used at all case joints. Use Mopar Gasket Maker for all case joints and Mopar silicone sealer or equivalent, for the input shaft bearing retainer. Apply these products as indicated in the assembly procedures.

CAUTION: The transmission shift components must be in the Neutral position during assembly. This prevents damage to the synchro and shift components when the housings are installed.

SYNCHRONIZER

To assemble each synchro install the springs, struts and detent balls one at a time as follows:

(1) Slide the sleeve part way onto the hub. Leave enough room to install the spring in the hub and the strut in the hub groove.

(2) Install the first spring in the hub. Then install a strut over the spring. Be sure the spring is seated in the spring bore in the strut.

(3) Slide the sleeve onto the hub just far enough to hold the first strut and spring in place.

(4) Place the detent ball in the top of the strut. Then carefully work the sleeve over the ball to hold it in place. Use a small flat blade screwdriver to press the ball into place while moving the sleeve over it.

(5) Repeat the procedure for the remaining springs, struts and balls. Tape or rubber band each strut and ball to temporarily secure as they are installed.

(6) Verify synchro springs, struts and detent balls are all in place (Fig. 48).

J9421-57

- 3 - SPRING (3)
- 4 - STRUT (3)
- 5 - DETENT BALL (3)
- 6 - HUB

MANUAL NV 3550 (Continued)

OUTPUT SHAFT

Lubricate shaft, gears and bearings with recommended lubricant during assembly. Petroleum jelly can be used to hold parts in place. Check bearing surfaces of output shaft for nicks or scratches. Smooth surfaces with 320/400 grit emery cloth if necessary. Apply oil to emery cloth and shaft surface before polishing.

Inspect and replace any synchro ring if worn or damaged. Immerse each synchro ring in lubricant before installation.

(1) Lubricate and install reverse gear needle bearing on shaft (Fig. 49). Slide bearing up against shoulder on output shaft.

**Fig. 49 REVERSE GEAR BEARING**

- 1 - REVERSE GEAR BEARING
- 2 - SHOULDER

(2) Install reverse gear over needle bearing (Fig. 50).

**Fig. 50 REVERSE GEAR**

- 1 - REVERSE GEAR

(3) Install brass synchro ring on reverse gear (Fig. 51).

(4) Assemble fifth-reverse synchro hub, sleeve, struts, springs and detent balls, if not previously done.

**Fig. 51 REVERSE SYNCHRO**

- 1 - REVERSE GEAR
- 2 - SYNCHRO RING

CAUTION: One side of the hub has shoulders around the hub bore, this side of the hub faces the front of the shaft. One side of the sleeve is tapered the tapered side faces the front of the shaft.

(5) Start fifth-reverse synchro assembly on output shaft splines by hand. Then seat synchro onto shaft with a press and Cup 6310-1 (Fig. 52).

**Fig. 52 FIFTH-REVERSE SYNCHRO ASSEMBLY**

MANUAL NV 3550 (Continued)

(31) Press 3-4 synchro assembly onto output shaft with shop press and suitable size pipe tool (Fig. 73).

NOTE: Place the pipe on hub as close to output shaft as possible without contacting the shaft splines.

Fig. 73 PRESS 3-4 SYNCHRO ON OUTPUT SHAF

- 1 - PRESS RAM
- 2 - PIPE TOOL
- 3 - 3-4 SYNCHRO
- 4 - THIRD SPEED SYNCHRO RING

(32) Install 3-4 synchro hub snap ring (Fig. 74) and verify snap ring is seated.

NOTE: Snap rings are available in thicknesses from 2.00 mm to 2.30 mm (0.078 to 0.090 in.). Install thickest snap ring that will fit in shaft groove.

(33) Install output shaft bearing.

(34) Install output shaft bearing snap ring, spreading it just enough to install it (Fig. 75). Verify snap ring is seated in shaft groove.

(35) Verify position of synchro sleeves before proceeding with assembly operations (Fig. 76). Grooved side of 3-4 sleeve should be facing forward. First gear side of 1-2 sleeve should be facing first gear. Tapered side of fifth-reverse sleeve should be facing forward.

SHIFT SHAFT AND BUSHINGS/BEARINGS

Inspect shift shaft bushing and bearing for damage and replace if necessary.

(1) Locate a bolt that will thread into the bushing without great effort.

(2) Thread the bolt into the bushing, allowing the bolt to make its own threads in the bushing.

(3) Attach a slide hammer or suitable puller to the bolt and remove bushing.

(4) Use the short end of Installer 8119 to install the new bushing.

(5) The bushing is correctly installed if the bushing is flush with the transmission case.

(6) To replace the bearing locate a bolt that will thread into the bearing without great effort.

(7) Thread the bolt into the bearing as much as possible.

(8) Attach a slide hammer or suitable puller to the bolt and remove the bearing.

(9) Use the short end of Installer 8119 to install the new bearing.

(10) The bearing is correctly installed if the bearing is flush with the transmission case.

DETENT PLUNGER BUSHING

Inspect detent plunger bushings for damage and replace if necessary.

NOTE: The detent plunger bushings are installed to a specific depth. The space between the two bushings when correctly installed contain an oil feed hole. Do not attempt to install the bushings with anything other than the specified tool or this oil hole may become restricted.

(1) Using the long end of Installer 8119, drive the detent bushings through the outer case and into the shift shaft bore.

(2) Remove the bushings from the shift shaft bore.

(3) Install a new detent plunger bushing on the long end of Installer 8118.

(4) Start the bushing in the detent plunger bore in the case.

(5) Drive the bushing into the bore until the tool contacts the transmission case.

(6) Install a new detent plunger bushing on the short end of Installer 8118.

(7) Start the bushing in the detent plunger bore in the case.

(8) Drive the bushing into the bore until the tool contacts the transmission case.

MANUAL NV 3550 (Continued)

GEARTRAIN ASSEMBLY

(1) Install Adapter 6747-1A on input shaft hub of Fixture 6747 (Fig. 80).

80aa0eaa

Fig. 80 ASSEMBLY FIXTURE FOR GEARTRAIN

- 1 - SPECIAL TOOL 6747-2A
- 2 - SPECIAL TOOL 8115
- 3 - SPECIAL TOOL 6747-1A
- 4 - SPECIAL TOOL 6747

(2) Install input shaft in fixture tool. Make sure Adapter 6747-1A is positioned under shaft as shown (Fig. 81).

(3) Install pilot bearing in input shaft (Fig. 81).

NOTE: The side of the pilot bearing with the small diameter goes toward the input shaft.

(4) Install fourth gear synchro ring on input shaft (Fig. 82).

(5) Adjust height of idler gear pedestal on assembly fixture (Fig. 83). Start with a basic height of 18.4 cm (7-1/4 in.). Final adjustment can be made after gear is positioned on pedestal.

80aa0eab

Fig. 81 PILOT BEARING AND INPUT SHAFT

- 2 - INPUT SHAFT

80aa0ead

Fig. 83 IDLER PEDESTAL BASIC HEIGHT

- 1 - REVERSE IDLER PEDESTAL

MANUAL NV 3550 (Continued)

(6) Install assembled output shaft and geartrain in input shaft (Fig. 84). Carefully rotate output shaft until the 3-4 synchro ring seats in synchro hub and sleeve.

Fig. 84 OUTPUT SHAFT AND GEARTRAIN

- 1 - OUTPUT SHAFT AND GEARTRAIN
- 2 - INPUT SHAFT
- 3 - FIXTURE

(7) Install Adapter 6747-2B on front bearing hub of countershaft. The adapter has a shoulder on one side that goes towards the countershaft.

(8) Slide countershaft (and adapter) into fixture slot. Verify countershaft and output shaft gears are fully meshed with the mainshaft gears (Fig. 85).

(9) Check alignment of countershaft and output shaft gear teeth. Note that gears may not align perfectly. A difference in height of 1.57 to 3.18 mm (1/16 to 1/8 in.) will probably exist. This difference will not interfere with assembly.

Fig. 85 COUNTERSHAFT ON FIXTURE

- 1 - OUTPUT SHAFT AND GEARTRAIN
- 2 - COUNTERSHAFT (SLIDE INTO PLACE ON FIXTURE TOOL)

(10) Position reverse idler in support cup of assembly fixture (Fig. 86). Ensure idler gear is properly meshed and aligned with shaft gear teeth and that bolt holes are facing out and not toward geartrain. Adjust pedestal up or down if necessary. Also be sure that short end of idler shaft is facing up as shown.

MANUAL NV 3550 (Continued)

**Fig. 86 REVERSE IDLER ASSEMBLY POSITION**

- 1 - OUTPUT SHAFT AND GEARTRAIN
- 2 - COUNTERSHAFT
- 3 - REVERSE IDLER ASSEMBLY
- 4 - TOOL PEDESTAL

(11) On 2-wheel drive transmission, thread one Alignment Pin 8120 in center or passenger side hole of output shaft bearing retainer. Then position retainer on fifth gear as shown (Fig. 87).

**Fig. 87 POSITIONING OUTPUT SHAFT BEARING**

- 1 - SPECIAL TOOL 8120
- 2 - OUTPUT SHAFT BEARING RETAINER

(12) Assemble 1-2 and fifth reverse-shift forks (Fig. 88). Arm of fifth-reverse fork goes through slot in 1-2 fork.

**Fig. 88 1-2 AND FIFTH-REVERSE**

- 1 - INSERT ARM THROUGH 1-2 FORK
- 2 - 1-2 FORK
- 3 - FIFTH-REVERSE FORK

(13) Install assembled shift forks in synchro sleeves (Fig. 89). Verify forks are properly seated in sleeves.

**Fig. 89 SHIFT FORKS IN SYNCHRO**

- 1 - SYNCHRO SLEEVES
- 2 - FORK ARMS
- 3 - SHIFT FORKS

REAR HOUSING - 2WD

(1) Drive adapter housing alignment dowels back into housing until dowels are flush with mounting surface (Fig. 90).

MANUAL NV 3550 (Continued)

**Fig. 90 REAR HOUSING DOWELS**

- 1 - HOUSING ALIGNMENT DOWELS
- 2 - REAR HOUSING
- 3 - DOWEL FLUSH WITH SURFACE

(2) Apply liberal quantity of petroleum jelly to countershaft rear bearing and bearing race.

(3) Install countershaft rear bearing in bearing race (Fig. 91).

**Fig. 91 COUNTERSHAFT REAR BEARING**

- 1 - COUNTERSHAFT REAR BEARING
- 2 - REAR BEARING RACE
- 3 - REAR HOUSING
- 4 - PETROLEUM JELLY

CAUTION: Be sure the large diameter side of the roller retainer faces the countershaft and the small diameter side faces the race and housing (Fig. 92).

(4) Apply extra petroleum jelly to hold countershaft rear bearing in place when housing is installed.

(5) Apply light coat of petroleum jelly to shift shaft bushing/bearing in rear housing (Fig. 92).

(6) Reach into countershaft rear bearing with finger and push each bearing roller outward against race. Then apply extra petroleum jelly to hold rollers in place. This avoids having rollers becoming displaced during housing installation.

**Fig. 92 COUNTERSHAFT REAR BEARING SEATED**

- 1 - SHIFT SHAFT BUSHING/BEARING
- 2 - COUNTERSHAFT REAR BEARING

(7) Install rear housing onto geartrain (Fig. 93). Verify bearing retainer pilot stud is in correct bolt hole in housing. Also be sure countershaft and output shaft bearings are aligned in housing and on countershaft. It may be necessary to lift upward on countershaft slightly to ensure that the countershaft rear bearing engages to the countershaft before the rear output shaft bearing engages the housing.

(8) Seat rear housing on output shaft rear bearing and countershaft. Use plastic or rawhide mallet to tap housing into place.

(9) Apply Mopar Gasket Maker or equivalent, to housing bolt threads, bolt shanks and under bolt heads (Fig. 94).

(10) Start first two bolts in retainer (Fig. 95). It may be necessary to move retainer rearward (with pilot stud) in order to start bolts in retainer.

MANUAL NV 3550 (Continued)**Fig. 93 REAR HOUSING - 2WD**

- 1 - REAR HOUSING
2 - SHIFT FORKS AND GEARTRAIN

**Fig. 94 SEAL RETAINING BOLTS**

- 1 - MOPAR GASKET MAKER (OR LOCTITE 518)
2 - RETAINER AND HOUSING BOLTS
3 - APPLY SEALER TO UNDERSIDE OF BOLT HEAD, SHANK AND THREADS

(11) Remove Alignment Pin 8120 and install last retainer bolt (Fig. 95).

(12) Tighten all three retainer bolts to 30-35 N·m (22-26 ft. lbs.).

**Fig. 95 PILOT STUD AND RETAINER BOLTS - 2WD**

- 1 - BEARING RETAINER BOLT
2 - SPECIAL TOOL 8120

ADAPTER HOUSING - 4WD

(1) Install rear bearing in adapter housing. Use wood hammer handle or wood dowel to tap bearing into place.

(2) Position rear bearing retainer in adapter housing (Fig. 96).

J9421-203

Fig. 96 ADAPTER HOUSING - 4WD

- 1 - BEARING RETAINER
2 - RETAINER BOLT
3 - IDLER SHAFT NOTCH
4 - COUNTERSHAFT BEARING RACE
5 - REAR BEARING

MANUAL NV 3550 (Continued)

(3) Apply Mopar Gasket Maker or equivalent, to threads, bolt shanks and under hex heads of bearing retainer bolts (Fig. 94).

(4) Apply liberal quantity of petroleum jelly to countershaft rear bearing and bearing race.

(5) Install countershaft rear bearing in bearing race (Fig. 92).

CAUTION: Be sure the large diameter side of the roller retainer faces the countershaft and the small diameter side faces the race and housing (Fig. 92).

(6) Apply extra petroleum jelly to hold countershaft rear bearing in place when housing is installed.

(7) Apply light coat of petroleum jelly to shift shaft bushing/bearing in adapter housing (Fig. 92).

(8) Install adapter housing on geartrain.

(9) Install rear bearing snap ring on output shaft (Fig. 97).

Fig. 97 REAR BEARING SNAP RING - 4WD

- 1 - SNAP RING PLIERS
- 2 - SNAP RING
- 3 - OUTPUT SHAFT

(10) Lubricate lip of new rear seal (Fig. 98) with Mopar Door Ease or transmission fluid.

(11) Install new rear seal in adapter housing bore with Installer C-3860-A. Verify seal is seated in housing bore (Fig. 98).

SHIFT SHAFT, SHAFT LEVER AND BUSHING AND SHIFT SOCKET

(1) Verify that all synchro sleeves are in Neutral position (centered on hub).

CAUTION: The transmission synchros must all be in Neutral position for assembly. Otherwise the housings, shift forks and gears can be damaged during installation of the two housings.

Fig. 98 REAR SEAL

- 1 - REAR SEAL
- 2 - SEAL LIP
- 3 - OUTPUT SHAFT

(2) Install 3-4 shift fork in synchro sleeve (Fig. 99). Verify that groove in fork arm is aligned with grooves in 1-2 and fifth-reverse fork arms as shown.

Fig. 99 3-4 SHIFT FORK

- 1 - 3-4 FORK
- 2 - ALIGN GROOVES IN FORK ARMS

(3) Slide the end of shift shaft with shaft detent notches through 3-4 shift fork.

(4) Assemble shift shaft shift lever and bushing (Fig. 100). Be sure slot in bushing is facing up and roll pin hole for lever is aligned with hole in shaft.

(5) Install assembled lever and bushing on shift shaft (Fig. 101).

(6) Slide shift shaft through 1-2 and fifth-reverse fork and into shift lever opening in rear housing (Fig. 102).

MANUAL NV 3550 (Continued)

**Fig. 100 LEVER AND BUSHING**

- 1 - SHAFT LEVER
- 2 - LEVER BUSHING
- 3 - BUSHING LOCK PIN SLOT

**Fig. 102 SHAFT IN LEVER OPENING**

**Fig. 101 LEVER AND BUSHING ASSEMBLY**

- 1 - SHIFT SHAFT
- 2 - SHAFT LEVER AND BUSHING
- 3 - 3-4 FORK

**Fig. 103 SHIFT SOCKET**

- 1 - SHIFT SOCKET
- 2 - SHIFT SHAFT

(7) Align shift socket with shaft and slide shaft through socket and into shift shaft bearing in rear housing (Fig. 103).

(8) Rotate shift shaft so detent notches in shaft are facing the TOP of the transmission housing.

CAUTION: Positioning of the shift shaft detent notch is important. Both of the shaft roll pins can be installed even when the shaft is 180° off. If this occurs, the transmission will have to be disassembled again to correct shaft alignment.

(9) Select correct new roll pin for shift shaft lever (Fig. 104). Shaft lever roll pin is approximately 22 mm (7/8 in.) long. Shift socket roll pin is approximately 33 mm (1-1/4 in.) long.

**Fig. 104 ROLL PIN IDENTIFICATION**

- 1 - SHAFT LEVER ROLL PIN
- 2 - SHIFT SOCKET ROLL PIN

MANUAL NV 3550 (Continued)

(10) Align roll pin holes in shift shaft, lever and bushing. Then start roll pin into shaft lever by hand (Fig. 105).

Fig. 105 ROLL PIN IN SHIFT SHAFT

- 1 - SHAFT LEVER ROLL PIN (1" LONG)
- 2 - LEVER AND BUSHING

(11) Seat shaft lever roll pin with pin punch (Fig. 106).

CAUTION: The shaft lever roll pin must be flush with the surface of the lever. The lever bushing will bind on the roll pin if the pin is not seated flush.

(12) Verify that lock pin slot in lever bushing is positioned as shown (Fig. 106).

Fig. 106 SHIFT SHAFT LEVER ROLL

- 1 - BUSHING LOCK PIN SLOT
- 2 - SEAT ROLL PIN FLUSH WITH LEVER

(13) Align roll pin holes in shift socket and shift shaft. Then start roll pin into shift shaft by hand (Fig. 107).

Fig. 107 ROLL PIN IN SHIFT SOCKET

- 1 - ROLL PIN
- 2 - SHIFT SOCKET
- 3 - SHIFT SHAFT

(14) Seat roll pin in shift socket with pin punch. Roll pin must be flush with socket (Fig. 108).

Fig. 108 SEATING SHIFT SOCKET ROLL PIN

- 1 - PIN PUNCH
- 2 - SHIFT SOCKET
- 3 - SEAT ROLL PIN FLUSH
- 4 - SHIFT SOCKET

(15) Verify that notches in shift fork arms are aligned. Realign arms if necessary.

MANUAL NV 3550 (Continued)

FRONT HOUSING AND INPUT SHAFT BEARING RETAINER

(1) Install reverse blocker, retainer and retainer bolt in front housing.

(2) If previously removed, input shaft bearing in front housing (Fig. 109). Install snap ring and use plastic mallet to seat bearing. Bearing goes in from front side of housing only.

Fig. 109 INPUT SHAFT AND COUNTERSHAFT FRONT BEARING

- 1 - INPUT SHAFT BEARING
- 2 - COUNTERSHAFT FRONT BEARING
- 3 - SHIFT SHAFT BUSHING

(3) Apply liberal quantity of petroleum jelly to countershaft front bearing. Then insert bearing in front housing race (Fig. 109). Large diameter side of bearing cage goes toward countershaft (Fig. 110). Small diameter side goes toward bearing race in housing.

(4) Reach into countershaft front bearing with finger, and push each bearing roller outward against race. Then apply extra petroleum jelly to hold rollers in place. This avoids having rollers becoming displaced during housing installation.

(5) Apply small amount of petroleum jelly to shift shaft bushing in front housing.

(6) Apply 1/8 in. wide bead of Mopar Gasket Maker or equivalent, to mating surfaces of front and rear housings (Fig. 111).

(7) Have helper hold rear housing and geartrain in upright position. Then install front housing on rear housing and geartrain.

(8) Work front housing downward onto geartrain until seated on rear housing.

CAUTION: If the front housing will not seat on the rear housing, either the shift components are not in Neutral, or one or more components are mis-

Fig. 110 COUNTERSHAFT FRONT BEARING

- 1 - BEARING RACE
- 2 - PETROLEUM JELLY
- 3 - COUNTERSHAFT FRONT BEARING

Fig. 111 SEAL FRONT/REAR HOUSINGS

- 1 - HOUSING FLANGE SURFACE
- 2 - MOPAR GASKET MAKER (OR LOCTITE 518)

aligned. Do not force the front housing into place. This will only result in damaged components.

(9) Tap rear housing alignment dowels back into place with hammer and pin punch. Both dowels should be flush fit in each housing. Have helper hold transmission upright while dowels are tapped back into place.

(10) Place transmission in horizontal position.

MANUAL NV 3550 (Continued)

(11) Apply Mopar Gasket Maker or equivalent to housing attaching bolts. Apply sealer material sealer to underside of bolt heads and to bolt shanks and threads (Fig. 112).

(12) Install and start housing attaching bolts by hand (Fig. 112). Then tighten bolts to 34 N·m (25 ft. lbs.).

Fig. 112 HOUSING BOLTS

1 - HOUSING ATTACHING BOLTS

(13) Install shift shaft bushing lock bolt (Fig. 113). Apply Mopar Gasket Maker or equivalent, to bolt threads, shank and underside of bolt head before installation.

CAUTION: If the lock bolt cannot be fully installed, do not try to force it into place. Either the shift shaft is not in Neutral or the shaft bushing (or lever) is misaligned.

Fig. 113 SHIFT SHAFT BUSHING LOCK BOLT

1 - SHIFT SHAFT LOCK BOLT
2 - SHAFT SOCKET

(14) Lubricate then install shift shaft detent plunger in housing bore (Fig. 114). Lubricate plunger with petroleum jelly or gear lubricant. **Verify plunger is fully seated in detent notch in shift shaft.**

80ba7a62

Fig. 114 SHIFT SHAFT DETENT PLUNGER

1 - FRONT HOUSING
2 - PLUG
3 - SPRING
4 - PLUNGER

(15) Install detent spring inside plunger (Fig. 114).

(16) Install plug on detent spring and compress spring. Then drive detent plug into transmission case until plug seats.

(17) Install backup light switch (Fig. 115).

J9421-133

Fig. 115 BACKUP LIGHT SWITCH

1 - BACKUP LIGHT SWITCH

(18) Install input shaft snap ring (Fig. 116).

(19) Install new oil seal in front bearing retainer with Installer 6448 (Fig. 117).

(20) Apply bead of Mopar silicone sealer or equivalent to flange surface of front bearing retainer (Fig. 118).

MANUAL NV 3550 (Continued)

**Fig. 116 SHAFT SNAP RING - TYPICAL**

1 - INPUT SHAFT SNAP RING

1 - SPECIAL TOOL 6448

2 - FRONT BEARING RETAINER

**Fig. 118 SEAL BEARING RETAINER AND HOUSING**

1 - APPLY SEALER BEAD

2 - INPUT SHAFT BEARING RETAINER

(21) Align and install front bearing retainer over input shaft and onto housing mounting surface (Fig. 119). Although retainer is one-way fit on housing, be sure bolt holes are aligned before seating retainer.

NOTE: Ensure no sealer gets into the oil feed hole in the transmission case or bearing retainer.

**Fig. 119 INPUT SHAFT BEARING RETAINER**

1 - INPUT SHAFT

2 - OIL FEED

3 - BEARING RETAINER

(22) Install and tighten bearing retainer bolts to 7-10 N·m (5-7 ft. lbs.) (Fig. 120).

**Fig. 120 BEARING RETAINER BOLTS**

1 - RETAINER

2 - RETAINER BOLTS

SHIFT TOWER AND LEVER

(1) Apply petroleum jelly to ball end of shift lever and interior of shift socket.

(2) Shift the transmission into third gear.

(3) Align and install shift tower and lever assembly (Fig. 121). Be sure shift ball is seated in socket

MANUAL NV 3550 (Continued)

and the offset in the tower is toward the passenger side of the vehicle before installing tower bolts.

(4) Install shift tower bolts (Fig. 122). Tighten bolts to 8.5 N·m (75.2 in. lbs.).

Fig. 121 SHIFT TOWER

- 1 - SHIFT TOWER
- 2 - SHIFT SOCKET
- 3 - SEAL

Fig. 122 SHIFT TOWER BOLTS

- 1 - SHIFT TOWER AND LEVER ASSEMBLY

(5) Fill transmission to bottom edge of fill plug hole with Mopar Transmission Lubricant.

(6) Install and tighten fill plug to 34 N·m (25 ft. lbs.).

(7) Check transmission vent. Be sure vent is open and not restricted.

EXTENSION HOUSING BUSHING

REMOVAL - YOKE BUSHING

(1) Raise and support vehicle.

(2) Mark reference lines on the propeller shaft and remove shaft.

(3) Remove housing yoke seal.

(4) Insert Remover 6957 into rear housing and tighten tool to bushing and remove bushing (Fig. 123).

80a11095

Fig. 123 Bushing Removal - Typical

- 1 - REMOVER
- 2 - EXTENSION HOUSING BUSHING

INSTALLATION - YOKE BUSHING

(1) Align bushing oil hole with oil slot in rear housing.

(2) Tap bushing into place with Installer 6951 and Handle C-4171.

(3) Install new oil seal in housing using Installer C-3972-A (Fig. 124).

80a7e2be

Fig. 124 Rear Housing Seal

- 1 - HANDLE
- 2 - INSTALLER

(4) Install propeller shaft with reference marks aligned.

(5) Remove support and lower vehicle.

(6) Check transmission fluid level.

EXTENSION HOUSING SEAL 2WD

REMOVAL - YOKE SEAL 2WD

- (1) Raise and support vehicle.
- (2) Mark propeller shaft and axle yoke for alignment reference.
- (3) Disconnect and remove propeller shaft.
- (4) Remove old seal with Remover C-3985-B (Fig. 125) from transmission housing.

Fig. 125 TRANSMISSION YOKE SEAL

- 1 - REMOVER
2 - SEAL

INSTALLATION - YOKE SEAL 2WD

- (1) Place seal in position on transmission housing.
- (2) Drive new seal into transmission housing with Installer C-3972-A and Handle C-4171 (Fig. 126).
- (3) Carefully guide propeller shaft slip yoke into housing and onto output shaft splines.
- (4) Install propeller shaft with reference marks aligned.

80a7e2be

Fig. 126 Transmission Housing Yoke Seal

- 1 - HANDLE
2 - INSTALLER

VEHICLE SPEED SENSOR

DESCRIPTION

The 3-wire Vehicle Speed Sensor (VSS) is located on the speedometer pinion gear adapter. If equipped with 4WD, this adapter is located on the extension housing of the transfer case (drivers side). If equipped with 2WD, this adapter is located on the left side of the transmission extension housing.

OPERATION

The VSS is a 3-circuit (3-wire), magnetic, hall-effect sensor.

The 3 circuits are:

- A 5-volt power supply from the Powertrain Control Module (PCM).
- A ground is provided for the sensor through a low-noise sensor return circuit in the PCM.
- An input to the PCM is used to determine vehicle speed and distance traveled.

The speed sensor generates 8 pulses per sensor revolution. These signals, in conjunction with a closed throttle signal from the throttle position sensor, indicate a closed throttle deceleration to the PCM. When the vehicle is stopped at idle, a closed throttle signal is received by the PCM (but a speed sensor signal is not received).

Under deceleration conditions, the PCM adjusts the Idle Air Control (IAC) motor to maintain a desired MAP value. Under idle conditions, the PCM adjusts the IAC motor to maintain a desired engine speed.

- (5) Remove support and lower vehicle.
- (6) Check transmission fluid level.

VEHICLE SPEED SENSOR (Continued)

REMOVAL

The Vehicle Speed Sensor (VSS) is located on the speedometer pinion gear adapter. If equipped with 4WD, this adapter is located on the transfer case extension (left side) (Fig. 127). If equipped with 2WD, this adapter is located on the extension housing of the transmission (left side).

Fig. 127 VSS Location

- 1 - SENSOR ELECTRICAL CONNECTOR
- 2 - SLIDE TAB
- 3 - 4WD TRANSFER CASE EXTENSION
- 4 - VEHICLE SPEED SENSOR
- 5 - RELEASE LOCK

- (1) Raise and support vehicle.
- (2) Disconnect electrical connector from sensor by pushing slide tab (Fig. 127). After slide tab has been positioned, push in on secondary release lock (Fig. 127) on side of connector and pull connector from sensor.

J9314-188

Fig. 128 VSS Removal/Installation

- 1 - ELECTRICAL CONNECTOR
- 2 - SENSOR MOUNTING BOLT
- 3 - O-RING
- 4 - SPEEDOMETER PINION GEAR
- 5 - SPEEDOMETER PINION GEAR ADAPTER
- 6 - O-RING
- 7 - VEHICLE SPEED SENSOR

- (3) Remove sensor mounting bolt (Fig. 128).
- (4) Remove sensor (pull straight out) from speedometer pinion gear adapter (Fig. 128). Do not remove gear adapter from transmission.

INSTALLATION

- (1) Clean inside of speedometer pinion gear adapter before installing speed sensor.
- (2) Install sensor into speedometer gear adapter and install mounting bolt. Before tightening bolt, verify speed sensor is fully seated (mounted flush) to speedometer pinion gear adapter.
- (3) Tighten sensor mounting bolt to 2.2 N·m (20 in. lbs.) torque.
- (4) Connect electrical connector to sensor.

AUTOMATIC - AW4

DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION

CONDITION	POSSIBLE CAUSE	CORRECTION
VEHICLE WILL NOT BACK UP OR MOVE FORWARD	1) Shift cable out of adjustment or damaged. 2) Valve body or primary regulator faulty. 3) Park lock pawl faulty. 4) Torque converter faulty. 5) Converter drive plate broken. 6) Oil pump intake screen blocked. 7) Transmission faulty.	1) Adjust cable or replace cable. 2) Inspect or repair the valve body. 3) Repair park pawl. 4) Replace torque converter. 5) Replace drive plate. 6) Clean oil pump intake screen. 7) Disassemble and repair transmission.
SHIFT LEVER POSITION INCORRECT	1) Shift cable out of adjustment. 2) Manual valve and lever faulty.	1) Adjust shifter cable. 2) Repair valve body.
HARSH ENGAGEMENT	1) Throttle valve cable out of adjustment. 2) Valve body or primary regulator valve faulty. 3) Accumulator pistons faulty. 4) Transmission faulty.	1) Adjust the throttle valve cable. 2) Repair valve body. 3) Repair pistons. 4) Disassemble and repair transmission.
DELAYED 1-2, 2-3, OR 3-4 UPSHIFTS, OR DOWNSHIFTS FROM 4-3 OR 3-2 AND SHIFTS BACK TO 4 OR 3	1) Solenoid faulty. 2) Valve body faulty. 3) Electronic control problem.	1) Repair or replace solenoid. 2) Repair valve body. 3) Use appropriate diagnostics to isolate malfunction.

AUTOMATIC - AW4 (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
SLIPS ON 1-2, 2-3, OR 3-4 UPSHIFTS, OR SLIPS OR SHUDDERS DURING ACCELERATION	1) Shift cable out of adjustment. 2) Throttle valve cable out of adjustment. 3) Solenoid faulty. 4) Valve body faulty. 5) Transmission faulty.	1) Adjust the shift cable. 2) Adjust throttle valve cable. 3) Repair or replace solenoid. 4) Repair valve body. 5) Disassemble and repair transmission.
DRAG OR BIND ON 1-2, OR 2-3 OR 3-4 UPSHIFT	1) Shift cable out of adjustment. 2) Valve body faulty. 3) Transmission faulty.	1) Adjust the shift cable. 2) Repair valve body. 3) Disassemble and repair transmission.
CONVERTER CLUTCH DOES NOT ENGAGE IN 2ND, 3RD, OR 4TH GEARS	1) Electronic control problem. 2) Solenoid faulty. 3) Valve body faulty. 4) Transmission faulty.	1) Use appropriate diagnostics to isolate malfunction. 2) Repair or replace the solenoid. 3) Repair valve body. 4) Disassemble and repair transmission.
HARSH DOWNSHIFTS	1) Throttle valve cable out of adjustment. 2) Throttle cable and cam faulty. 3) Accumulator pistons faulty. 4) Valve body faulty. 5) Transmission faulty.	1) Adjust the throttle valve cable. 2) Replace the throttle cable and cam. 3) Repair the accumulator pistons. 4) Repair valve body. 5) Disassemble and repair transmission.
NO DOWNSHIFT WHEN COASTING	1) Solenoid faulty. 2) Electronic control problem. 3) Valve body faulty.	1) Repair or replace the solenoid. 2) Use appropriate diagnostics to isolate malfunction. 3) Repair valve body.
DOWNSHIFT LATE OR EARLY DURING COAST	1) Throttle cable faulty. 2) Solenoid faulty. 3) Electronic control problem. 4) Valve body faulty. 5) Transmission faulty.	1) Replace cable. 2) Repair or replace the solenoid. 3) Use appropriate diagnostics to isolate malfunction. 4) Repair valve body. 5) Disassemble and repair transmission.
NO 4-3, 3-2, OR 2-1 KICKDOWN	1) Solenoid faulty. 2) Electronic control problem. 3) Valve body faulty.	1) Repair or replace the solenoid. 2) Use appropriate diagnostics to isolate malfunction. 3) Repair valve body.

AUTOMATIC - AW4 (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
NO ENGINE BRAKING IN 1-2 POSITION	1) Solenoid faulty. 2) Electronic control problem. 3) Valve body faulty. 4) Transmission faulty.	1) Repair or replace the solenoid. 2) Use appropriate diagnostics to isolate malfunction. 3) Repair valve body. 4) Disassemble and repair transmission.
VEHICLE DOES NOT HOLD IN PARK	1) Shift cable out of adjustment. 2) Parking pawl cam and spring faulty.	1) Adjust the shifter cable. 2) Replace the parking pawl and cam.
OVERHEAT DURING NORMAL OPERATION (FLUID DISCOLORED, SMELLS BURNED)	1) Low fluid level. 2) Fluid cooler or lines blocked or cooler cracked.	1) Add fluid and check for leaks. 2) Flush cooler and lines and replace radiator if there is transmission fluid mixed with coolant.
OVERHEAT DURING COMMERCIAL OPERATION OR WHILE TRAILER TOWING (FLUID DARK AND BURNED WITH SOME SLUDGE FORMATION)	1) Vehicle not properly equipped for trailer towing or commercial use. 2) Vehicle not equipped with auxiliary cooler. 3) Tow vehicle overloaded vehicle tow capacity exceeded). 4) Air flow to auxiliary cooler blocked or restricted.	1) Be sure that the vehicle is equipped with all recommended optional components. 2) Drain fluid, change filter and install an auxiliary cooler. 3) Be sure the vehicle is properly equipped to handle load. 4) Remove or reposition the blockage or obstruction.
OIL COMES OUT THE FILLER TUBE	1) Transmission overfilled. 2) Breather vent in oil pump blocked. 3) Fluid cooler or cooler lines plugged.	1) Drain fluid to correct level. 2) Inspect and clear blockage. 3) Flush cooler and lines.

INPUT SHAFT SPEED SENSOR

DESCRIPTION

The Input and Output Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the output shaft speed sensor rotor. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the transmission gear ratio.

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage.
- Torque converter element speed ratio.

VALVE BODY SOLENOIDS

DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed**. The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** solenoid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must therefore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.

The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

- Increase the amount of current applied to the coil or

- Increase the number of turns of wire in the coil.

The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the plunger also contribute to the response speed possible by a particular solenoid design.

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-width modulated versions utilize similar methods to control the current flow through the solenoid to position the solenoid plunger at a desired position somewhere between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

OPERATION

When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

ASSEMBLY	49	INSTALLATION.....	61

TRANSFER CASE NV-231

DISASSEMBLY

Position transfer case on shallow drain pan. Remove drain plug and drain lubricant remaining in case.

REAR RETAINER AND OIL PUMP

- (1) Remove the speedometer adapter.
- (2) Spread band clamp which holds output shaft boot to the output shaft slinger, or output shaft damper, with a suitable awl, or equivalent.
- (3) Remove output shaft boot from slinger, or output shaft damper, and output shaft.
- (4) If the vehicle is equipped with an automatic transmission, remove the output shaft rear slinger using Puller MD-998056-A (Fig. 1).

Fig. 1 Rear Slinger Removal

- 1 - TRANSFER CASE
- 2 - SPECIAL TOOL MD-998056-A
- 3 - SLINGER

- (5) If the vehicle is equipped with a manual transmission, use Screws 8421 and the puller yoke and forcing screw from a bolt-grip puller set, such as those used to remove steering wheels and harmonic balancers, to remove the transfer case output shaft damper.

- (6) Use a suitable pry tool, or a slide hammer mounted screw, to remove the seal from the rear retainer (Fig. 2).

- (7) Remove the rear output bearing I.D. retaining ring (Fig. 3).

- (8) Remove the bolts holding the rear retainer to the rear case half.

Fig. 2 Rear Retainer Seal

- 1 - REAR RETAINER
- 2 - OUTPUT SHAFT SEAL

Fig. 3 Output Shaft Rear Bearing Retaining Ring

- 1 - SNAP-RING PLIERS
- 2 - REAR BEARING I.D. RETAINING RING

TRANSFER CASE NV-231 (Continued)

(9) Tap rear retainer with rawhide or rubber mallet to loosen sealer bead.

(10) Remove rear retainer from rear case half (Fig. 4).

Fig. 4 Rear Retainer Removal

- 1 - MAINSHAFT
- 2 - REAR RETAINER

(11) Remove snap-ring holding oil pump in position on output shaft.

(12) Disengage oil pickup tube from oil pump and remove oil pump assembly. Remove oil pump by tilting the edge of the oil pump from under the edge of the rear case half and sliding the pump (Fig. 5).

Fig. 5 Oil Pump Removal

- 1 - OIL PUMP

(13) Remove pick-up tube o-ring from oil pump (Fig. 6), if necessary. Do not disassemble the oil pump, it is not serviceable.

YOKE AND RANGE LEVER

- (1) Remove transfer case indicator switch.
- (2) Remove front yoke nut as follows:
 - (a) Move range lever to 4L position.
 - (b) Then remove nut with socket and impact wrench (Fig. 7).

RR21F27

Fig. 6 Pick-up Tube O-ring Location

- 1 - OIL PUMP
- 2 - O-RING

(3) Remove yoke. If yoke is difficult to remove by hand, remove it with bearing splitter, or with standard two jaw puller (Fig. 8). Be sure puller tool is positioned on yoke and not on slinger as slinger will be damaged.

800010957

Fig. 7 Yoke Nut Removal

- 1 - IMPACT WRENCH
- 2 - SOCKET
- 3 - YOKE

(4) Remove seal washer from front output shaft. Discard washer as it should not be reused.

(5) Remove nut and washer that attach range lever to sector shaft. Then move sector to neutral position and remove range lever from shaft (Fig. 9).

TRANSFER CASE NV-231 (Continued)

FRONT OUTPUT SHAFT AND DRIVE CHAIN

(1) Support transfer case so rear case is facing upward.

(2) Remove bolts holding front case to rear case. The case alignment bolts require flat washers (Fig. 10).

(3) Loosen rear case with flat blade screwdriver to break sealer bead. Insert pry tool blade only into notches provided at each end of case (Fig. 11).

(4) Remove rear case from front case.

J9321-14

INPUT GEAR AND LOW RANGE GEAR

(1) Remove front bearing retainer attaching bolts (Fig. 23).

(2) Remove front bearing retainer. Pry retainer loose with pry tool positioned in slots at each end of retainer (Fig. 24).

(3) Remove front bearing retainer seal. Tap seal out with drift and hammer.

(4) Remove input gear retaining ring with heavy duty snap-ring pliers (Fig. 25)

TRANSFER CASE NV-231 (Continued)

ASSEMBLY

Lubricate transfer case components with Mopar® ATF +4, type 9602, Automatic Transmission Fluid or petroleum jelly (where indicated) during assembly.

BEARINGS AND SEALS

CAUTION: The bearing bores in various transfer case components contain oil feed holes. Make sure replacement bearings do not block the holes.

TRANSFER CASE NV-231 (Continued)

(1) Remove the front output shaft seal from case with pry tool (Fig. 32).

(2) Remove the front output shaft bearing retaining ring with screwdriver (Fig. 33).

(3) Remove bearing with Tool Handle C-4171 and Tool 5065 (Fig. 34).

Fig. 35 Front Output Shaft Bearing Installation

- 1 - SPECIAL TOOL C-4171
- 2 - SPECIAL TOOL 5064

(5) Install output shaft front bearing retaining ring (Fig. 36). Start ring into place by hand. Then use small screwdriver to work ring into case groove. Be sure ring is fully seated before proceeding.

TRANSFER CASE NV-231 (Continued)

Fig. 36 Installing Output Shaft Front Bearing Retaining Ring

1 - WORK RETAINING RING INTO BORE GROOVE WITH SMALL SCREWDRIVER

(6) Install new front output seal in front case with Installer Tool 8143-A as follows:

(a) Place new seal on tool. **Garter spring on seal goes toward interior of case.**

(b) Start seal in bore with light taps from hammer (Fig. 37). Once seal is started, continue tapping seal into bore until installer tool bottoms against case.

Fig. 37 Front Output Seal Installation

1 - INSTALLER 8143-A
2 - TRANSFER CASE

(7) Remove the output shaft rear bearing with the screw and jaws from Remover L-4454 and Cup 8148 (Fig. 38).

(8) Install new bearing with Tool Handle C-4171 and Installer 5066 (Fig. 39). The bearing bore is chamfered at the top. Install the bearing so it is flush with the lower edge of this chamfer (Fig. 40).

(9) Using Remover C-4210 and Handle C-4171, drive input shaft bearing from inside the annulus gear opening in the case (Fig. 41).

**Fig. 41 Input Shaft Bearing Removal**

- 1 - SPECIAL TOOL C-4171
2 - SPECIAL TOOL C-4210

(10) Install locating ring on new bearing.
(11) Position case so forward end is facing upward.
(12) Using Remover C-4210 and Handle C-4171, drive input shaft bearing into case. The bearing locating ring must be fully seated against case surface (Fig. 42).

(13) Remove input gear pilot bearing by inserting a suitably sized drift into the splined end of the input gear and driving the bearing out with the drift and a hammer (Fig. 43).

**Fig. 42 Seating Input Shaft Bearing**

- 1 - SNAP-RING

 2 - RETAINER PLATE
 3 - INPUT GEAR
 4 - LOW RANGE GEAR
 5 - THRUST WASHERS

INPUT AND LOW RANGE GEAR

(1) Install first thrust washer in low range gear (Fig. 48). Be sure washer tabs are properly aligned in gear notches.

(2) Install input gear in low range gear. Be sure input gear is fully seated.

(3) Install remaining thrust washer in low range gear and on top of input gear. Be sure washer tabs are properly aligned in gear notches.

(4) Install retainer on input gear and install snap-ring.

INPUT GEAR AND LOW RANGE GEAR

(1) Align and install low range/input gear assembly in front case (Fig. 49). Be sure low range gear pinions are engaged in annulus gear and that input gear shaft is fully seated in front bearing.

(2) Install snap-ring to hold input/low range gear into front bearing (Fig. 50).

(3) Clean gasket sealer residue from retainer and inspect retainer for cracks or other damage.

(4) Apply a 3 mm (1/8 in.) bead of Mopar® gasket maker or silicone adhesive to sealing surface of retainer.

(5) Align cavity in seal retainer with fluid return hole in front of case.

CAUTION: Do not block fluid return cavity on sealing surface of retainer when applying Mopar® gasket maker or silicone adhesive sealer. Seal failure and fluid leak can result.

(6) Install bolts to hold retainer to transfer case (Fig. 51). Tighten to 21 N·m (16 ft. lbs.) of torque.

**Fig. 49 Input/Low Range Gear Installation**

- 1 - ANNULUS GEAR
 2 - INPUT/LOW RANGE GEAR

MAINSHAFT

(1) Lubricate mainshaft splines with recommended transmission fluid.

(2) Slide drive sprocket onto mainshaft.

(3) Slide mode hub onto mainshaft.

(4) Install mode hub retaining ring. Verify that the retaining ring is fully seated in mainshaft groove.

TRANSFER CASE NV-231 (Continued)

- 1 - SHIFT SECTOR

SHIFT FORKS AND MAINSHAFT

(1) Install new sector shaft O-ring and bushing (Fig. 52).

(2) Install shift sector in case (Fig. 53). Lubricate sector shaft with transmission fluid before installation.

(3) Install range lever, washer, and nut on sector shaft (Fig. 54). Tighten range lever nut to 27-34 N·m (20-25 ft. lbs.) torque.

(4) Assemble and install range fork and hub (Fig. 55). Be sure hub is properly seated in low range gear and engaged to the input gear.

TRANSFER CASE NV-231 (Continued)

**Fig. 54 Range Lever Installation**

- 1 - RANGE LEVER
2 - LEVER NUT

(5) Align and insert range fork pin in shift sector slot.

**Fig. 55 Install Range Fork And Hub Assembly**

- 1 - RANGE HUB
2 - RANGE FORK

(6) Install assembled mainshaft (Fig. 56). Be sure shaft is seated in pilot bearing and input gear.

**Fig. 56 Mainshaft Assembly Installation**

- 1 - DRIVE SPROCKET
2 - MODE HUB
3 - MAINSHAFT

- (7) Install new pads on mode fork if necessary.
(8) Insert mode sleeve in mode fork mode fork. Be sure long side of sleeve is toward long end of shift rail (Fig. 57).

**Fig. 57 Assembling Mode Fork And Sleeve**

- 1 - MODE SLEEVE
2 - MODE FORK AND RAIL

(9) Install assembled mode fork and sleeve (Fig. 58). Be sure fork rail goes through range fork and into case bore. Also be sure sleeve is aligned and seated on mainshaft hub.

**Fig. 58 Mode Fork And Sleeve Installation**

- 1 - MODE SLEEVE
2 - MODE FORK AND RAIL

TRANSFER CASE NV-231 (Continued)

- (10) Rotate sector to NEUTRAL position.
- (11) Install new O-ring on detent plug (Fig. 59).
- (12) Lubricate detent plunger with transmission fluid or light coat of petroleum jelly.
- (13) Install detent plunger, spring and plug (Fig. 59).
- (14) Verify that plunger is properly engaged in sector.

8001096a

Fig. 59 Shift Detent Components

- 1 - POPPET
- 2 - SPRING
- 3 - SCREW
- 4 - POPPET BORE (IN CASE)

FRONT OUTPUT SHAFT AND DRIVE CHAIN

- (1) Lubricate front output shaft-sprocket assembly, drive chain, and drive sprocket with transmission fluid.
- (2) Assemble drive chain and front output shaft (Fig. 60).
- (3) Start chain on mainshaft drive sprocket.
- (4) Guide front shaft into bearing and drive sprocket onto mainshaft drive gear (Fig. 60).
- (5) Install mode spring on upper end of mode fork shift rail (Fig. 61).

OIL PUMP AND REAR CASE

- (1) Install magnet in front case pocket (Fig. 62).
- (2) Assemble oil pickup screen, connecting hose, and tube.

J9321-72

1 - OIL PUMP
2 - O-RING

(4) Insert oil pickup tube in oil pump inlet.
(5) Position assembled oil pump and pickup tube in rear case. Be sure pickup screen is securely seated in case slot. Also be sure oil pump locating tabs are outside rear case (Fig. 64).

(6) Apply 3 mm (1/8 in.) wide bead of Mopar® gasket maker or silicone adhesive sealer to mounting flange of front case. Work sealer bead around bolt holes.

(7) Lift rear case and oil pump and carefully position assembly on front case. Be sure case dowels are aligned and that mode fork rail extends through rear case before seating rear case on front case.

800bdf98

Fig. 64 Oil Pump And Pickup Tube Installation

1 - OIL PUMP
2 - PICKUP TUBE
3 - PICKUP SCREEN AND CONNECTOR

(8) Install case attaching bolts. Alignment bolts at each end of case are only ones requiring washers (Fig. 65).

(9) Tighten case bolts to 27-34 N·m (20-25 ft. lbs.) torque.

J9321-13

Fig. 65 Alignment Bolt Location

1 - ALIGNMENT BOLT AND WASHER (AT EACH END OF CASE)

YOKE AND RANGE LEVER

(1) Install indicator switch in front case. Tighten switch to 20-34 N·m (15-25 ft. lbs.) torque.

(2) Install range lever, washer and locknut on sector shaft (Fig. 66). Tighten locknut to 27-34 N·m (20-25 ft. lbs.) torque.

(3) Install new seal washer on front output shaft (Fig. 68).

(4) Lubricate yoke hub with transmission fluid and install yoke on front shaft.

(5) Install new seal washer on front shaft.

(6) Install yoke and new yoke nut on front output shaft (Fig. 67).

(7) Tighten yoke nut to 122-176 N·m (90-130 ft. lbs.) torque. Use Tool C-3281, or similar tool to hold yoke while tightening yoke nut.

- 1 - YOKE SEAL WASHER

REAR RETAINER

(1) Apply bead of Mopar® Sealer P/N 82300234, or Loctite™ Ultra Gray, to mating surface of rear retainer. Sealer bead should be a maximum of 3/16 inch.

(2) Install rear retainer on rear case. Tighten retainer bolts to 20-27 N·m (15-20 ft. lbs.) torque.

(3) Install rear bearing I.D. retaining ring and spacer on output shaft.

(4) Apply liberal quantity of petroleum jelly to new rear seal and to output shaft. Petroleum jelly is needed to protect seal lips during installation.

(5) Slide seal onto Seal Protector 6992 (Fig. 69). Slide seal protector and seal onto output shaft.

(6) Slide Installer C-4076-B onto seal protector with the recessed side of the tool toward the seal. Drive seal into rear bearing retainer with Installer C-4076-B and Handle MD-998323 (Fig. 70).

**Fig. 69 Output Shaft Seal and Protector**

- 1 - OUTPUT SHAFT SEAL
- 2 - SPECIAL TOOL 6992
- 3 - TRANSFER CASE

(7) Install a new output shaft rear slinger with Installer 8408, if the vehicle is equipped with an automatic transmission.

(8) If the vehicle is equipped with a manual transmission, install the output shaft damper as follows:

(a) Position the damper weight on the output shaft. Start the damper onto the output shaft chamfer, being careful to keep the weight square to the output shaft. (Fig. 71)

(b) Position the driver portion of Installer 8422 (Fig. 72) onto the damper, making sure the legs of the damper are positioned through the slots of the damper.

(c) Thread the puller screw of Installer 8422 into the output shaft by hand only. Make sure the screw is fully threaded into the output shaft.

TRANSFER CASE NV-231 (Continued)

**Fig. 70 Rear Seal Installation**

- 1 - SPECIAL TOOL C-4076-B
- 2 - SPECIAL TOOL MD-998323
- 3 - TRANSFER CASE

(d) Using a wrench to hold the pulling screw stationary (Fig. 73), turn the pulling screw nut until the driver legs contact the rear face of the transfer case rear retainer. When the legs contact the retainer, the damper is properly positioned on the output shaft.

VEHICLE SPEED SENSOR

REMOVAL

The Vehicle Speed Sensor (VSS) is located on the speedometer pinion gear adapter. If equipped with 4WD, this adapter is located on the transfer case extension (left side) (Fig. 75). If equipped with 2WD, this adapter is located on the extension housing of the transmission (left side).

- (1) Raise and support vehicle.
- (2) Disconnect electrical connector from sensor by pushing slide tab (Fig. 75). After slide tab has been positioned, push in on secondary release lock (Fig. 75) on side of connector and pull connector from sensor.
- (3) Remove sensor mounting bolt (Fig. 76).
- (4) Remove sensor (pull straight out) from speedometer pinion gear adapter (Fig. 76). Do not remove gear adapter from transmission.

INSTALLATION

- (1) Clean inside of speedometer pinion gear adapter before installing speed sensor.
- (2) Install sensor into speedometer gear adapter and install mounting bolt. Before tightening bolt, verify speed sensor is fully seated (mounted flush) to speedometer pinion gear adapter.
- (3) Tighten sensor mounting bolt to 2.2 N·m (20 in. lbs.) torque.
- (4) Connect electrical connector to sensor.

1.0 INTRODUCTION

The procedures contained in this manual include specifications, instructions, and graphics needed to diagnose the PCM Powertrain System. The diagnostics in this manual are based on the failure condition or symptom being present at time of diagnosis.

Please follow the recommendations below when choosing your diagnostic path.

1. First make sure the DRBIII® is communicating with the appropriate modules; ie., if the DRBIII® displays a "No Response" condition, you must diagnose this first before proceeding.
2. Read DTC's (diagnostic trouble codes) with the DRBIII®.
3. If no DTC's are present, identify the customer complaint.
4. Once the DTC or customer complaint is identified, locate the matching test in the Table of Contents and begin to diagnose the symptom.

All component location views are in Section 8.0. All connector pinouts are in Section 9.0. All system schematics are in Section 10.0.

An * placed before the symptom description indicates a customer complaint.

When repairs are required, refer to the appropriate service manual for the proper removal and repair procedure.

Diagnostic procedures change every year. New diagnostic systems may be added; carryover systems may be enhanced. **READ THIS MANUAL BEFORE TRYING TO DIAGNOSE A VEHICLE DTC.** It is recommended that you review the entire manual to become familiar with all new and changed diagnostic procedures.

After using this book, if you have any comments or recommendations, please fill out the form at the back of the book and mail it back to us.

1.1 SYSTEM COVERAGE

This diagnostic procedures manual covers the 2001 XJ Jeep Cherokee with 4.0L engines.

1.2 SIX-STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the powertrain control module (PCM) is done in six basic steps:

- verification of complaint
- verification of any related symptoms
- symptom analysis
- problem isolation
- repair of isolated problem
- verification of proper operation

2.0 IDENTIFICATION OF SYSTEM

The Powertrain Control Module (PCM) monitors and controls:

- Fuel system
- Ignition system
- charging system
- speed control system
- cooling system

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

3.1 GENERAL DESCRIPTION

These Sequential Fuel Injection (SFI) engine systems have the latest in technical advances. The on-board Euro Stage III OBD diagnostics incorporated with the powertrain control module (PCM) are intended to assist the field technician in repairing vehicle problems by the quickest means.

3.2 FUNCTION OPERATION

3.2.1 FUEL CONTROL

The PCM controls the air/fuel ratio of the engine by varying fuel injector on time. Mass air flow is calculated using the speed density method using engine speed, manifold absolute pressure, and air temperature change.

Different fuel calculation strategies are used dependent on the operational state of the engine. During crank mode, a prime shot fuel pulse is delivered followed by fuel pulses determined by a crank time strategy. Cold engine operation is determined via an open loop strategy until the O2 sensors have reached operating temperature. At this point, the strategy enters a closed loop mode where fuel requirements are based upon the state of the O2 sensors, engine speed, MAP, throttle position, air temperature, battery voltage, and coolant temperature.

3.2.2 ON-BOARD DIAGNOSTICS

The PCM has been programmed to monitor many different circuits of the fuel injection system. This monitoring is called "on-board diagnosis."

Certain criteria, or "arming conditions," must be met for a DTC to be entered into the PCM memory. The criteria may be a range of: engine rpm, engine temperature, and/or input voltage to the PCM. If a problem is sensed with a monitored circuit, and all

GENERAL INFORMATION

of the criteria or arming conditions are met, then a DTC will be stored in the PCM.

It is possible that a DTC for a monitored circuit may not be entered into the PCM memory even though a malfunction has occurred. This may happen because one of the trouble code criteria (arming conditions) have not been met.

The PCM compares input signal voltages from each input device with specifications (the established high and low limits of the range) that are programmed into it for that device. If the input voltage is not within specifications and other DTC criteria (arming conditions) are met, a DTC will be stored in the PCM memory.

The On Board Diagnostics have evolved to the third Generation of Diagnostics referred to as Euro Stage III OBD. These Euro Stage III OBD Diagnostics control the functions necessary to meet the requirements of Euro Stage III OBD regulation. These requirements specify the inclusion of a Malfunction Indicator Light (MIL) located on the instrument panel for all 1994 and subsequent model-year passenger cars, light duty trucks, and medium-duty vehicles. The purpose of the MIL is to inform the vehicle operator in the event of a malfunction of any emission system or component.

The following table summarizes the various Euro Stage III OBD monitors operation.

EURO STAGE III OBD MONITOR INFORMATION

Comprehensive Components Monitor	Major Monitors Non Fuel Control & Non Misfire	Major Monitors Fuel Control & Misfire
Run constantly	Run Once Per Trip	Run Constantly
Includes All Engine Hardware - Sensors, Switches, Solenoids, etc.	Monitors Entire Emission System	Monitors Entire System
One Trip Faults - Turns On The MIL and Sets DTC After One Failure	Two Trip Faults - Turns On The MIL and Sets DTC After Two Consecutive Failures	Two Trip Faults - Turns On The MIL and Sets DTC After Two Consecutive Failures
Priority 3	Priority 1 or 3	Priority 2 or 4
All Checked For Continuity	Done Stop Testing = Yes	<div>Fuel Control Monitor Monitors Fuel Control System For: Fuel System Lean Fuel System Rich Requires 3 Consecutive <i>Fuel System Good Trips</i> To Extinguish The MIL</div>
Open	Oxygen Sensor Heater Oxygen Sensor Response	
Short To Ground		
Short To Voltage		
Inputs Checked For Rationality	<div>Catalytic Converter Efficiency Except EWMA - up to 6 tests per trip and a one trip fault</div>	<div>Misfire Monitor Monitors For Engine Misfire at: 1000 RPM Counter (Type B) **200 RPM Counter (Type A) Requires 3 Consecutive <i>Misfire Good Trips</i> To Extinguish the MIL **Type A misfire is a one trip failure. The MIL will illuminate and blink at the first failure.</div>
Outputs Checked For Functionality	EGR System	
	Evaporative Emission System	
Requires 3 Consecutive <i>Global/Alternate Good Trips</i> to Extinguish the MIL*	Requires 3 Consecutive <i>Global Good Trips</i> to Extinguish the MIL*	
<div>*40 Warm Up Cycles are required to erase DTC's <i>after</i> the MIL has been extinguished.</div>		

3.2.3 TRANSMISSION CONTROL

The automatic transmission for this vehicle is an AW4 model controlled by a separate controller. Further explanation of the transmission control and operation can be found in the AW4 transmission diagnostic manual.

3.2.4 OTHER CONTROLS

CHARGING SYSTEM

The charging system is turned on when the engine is started and ASD relay energized. When the ASD relay is on, ASD output voltage is supplied to the ASD sense circuit at the PCM. This voltage is connected in some cases, through the PCM and supplied to one of the generator field terminals (Gen Source +). All others, the Gen field is connected directly to the ASD output voltage. The amount of current produced by the generator is controlled by the Electronic Voltage Regulator (EVR) circuitry, in the PCM. A battery temperature sensor, located either in the battery tray, using the ambient sensor, or in the PCM itself, is used to sense battery temperature. This temperature along with sensed line voltage, is used by the PCM to vary the battery charging rate. This is done by cycling the ground path to the other generator field terminal (Gen field driver).

SPEED CONTROL SYSTEM

The PCM controls vehicle speed by operation of the speed control servo vacuum and vent solenoids. Energizing the vacuum solenoid applies vacuum to the servo to increase throttle position. Operation of the vent solenoid slowly releases the vacuum allowing throttle position to decrease. A special dump solenoid allows immediate release of throttle position caused by braking, cruise control switch turned off, shifting into neutral, excessive RPM (tires spinning) or ignition off.

LEAK DETECTION PUMP SYSTEM

The leak detection pump is a device that pressurizes the evaporative system to determine if there are any leaks. When certain conditions are met, the PCM will activate the pump and start counting pump strokes. If the pump stops within a calibrated number of strokes, the system is determined to be normal. If the pump does not stop or stops too soon, a DTC will be set.

3.2.5 PCM OPERATING MODES

As input signals to the powertrain control module (PCM) change, the PCM adjusts its response to output devices. For example, the PCM must calculate a different injector pulse width and ignition timing for idle than it does for wide open throttle.

There are several different modes of operation that determine how the PCM responds to the various input signals.

There are two types of engine control operation: **open loop** and **closed loop**.

In **open loop** operation, the PCM receives input signals and responds according to preset programming. Inputs from the heated oxygen sensors are not monitored.

In **closed loop** operation, the PCM monitors the inputs from the heated oxygen sensors. This input indicates to the PCM whether or not the calculated injector pulse width results in the ideal air-fuel ratio of 14.7 parts air to 1 part fuel. By monitoring the exhaust oxygen content through the oxygen sensor, the PCM can fine tune injector pulse width. Fine tuning injector pulse width allows the PCM to achieve the lowest emission levels while maintaining optimum fuel economy.

The engine start-up (crank), engine warm-up, and wide open throttle modes are open loop modes. Under most operating conditions, closed loop modes occur with the engine at operating temperature.

IGNITION SWITCH ON (ENGINE OFF) MODE

When the ignition switch activates the fuel injection system, the following actions occur:

1. The PCM determines atmospheric air pressure from the MAP sensor input to determine basic fuel strategy.
2. The PCM monitors the engine coolant temperature sensor and throttle position sensor input. The PCM modifies fuel strategy based on this input.

When the key is in the "on" position and the engine is not running (zero rpm), the auto shutdown relay and fuel pump relay are not energized. Therefore, voltage is not supplied to the fuel pump, ignition coil, and fuel injectors.

Engine Start-up Mode — This is an open loop mode. The following actions occur when the starter motor is engaged:

1. The auto shutdown and fuel pump relays are energized. If the PCM does not receive the camshaft and crankshaft signal within approximately one second, these relays are de-energized.
2. The PCM energizes all fuel injectors until it determines crankshaft position from the camshaft and crankshaft signals. The PCM determines crankshaft position within one engine revolution. After the crankshaft position has been determined, the PCM energizes the fuel injectors in sequence. The PCM adjusts the injector pulse width and synchronizes the fuel injectors by controlling the fuel injectors' ground paths.

Once the auto shutdown and fuel pump relays have been energized, the PCM determines the fuel injector pulse width based on the following:

- engine coolant temperature
- manifold absolute pressure
- intake air temperature
- engine revolutions
- throttle position

The PCM determines the spark advance based on the following:

- engine coolant temperature
- crankshaft position
- camshaft position
- intake air temperature
- manifold absolute pressure
- throttle position

Engine Warm-Up Mode – This is an open loop mode. The PCM adjusts injector pulse width and controls injector synchronization by controlling the fuel injectors' ground paths. The PCM adjusts ignition timing and engine idle speed. The PCM adjusts the idle speed by controlling the idle air control motor.

Cruise or Idle Mode – When the engine is at normal operating temperature, this is a closed loop mode. During certain idle conditions, the PCM may enter into a variable idle speed strategy. At this time, the PCM adjusts engine speed based on the following inputs:

- throttle position
- battery voltage
- engine coolant temperature

Acceleration Mode – This is a closed loop mode. The PCM recognizes an increase in throttle position and a decrease in Manifold Vacuum as engine load increases. In response, the PCM increases the injector pulse width to meet the increased load.

Deceleration Mode – This is a closed loop mode. The PCM recognizes a decrease in throttle position and an increase in Manifold Vacuum as engine load decreases. In response, the PCM decreases the injector pulse width to meet the decreased load.

Wide Open Throttle Mode – This is an open loop mode. The throttle position sensor notifies the PCM of a wide open throttle condition. The PCM adjusts injector pulse width to supply a predetermined amount of additional fuel.

3.2.6 NON-MONITORED CIRCUITS

The PCM does not monitor the following circuits, systems, and conditions even though they could have malfunctions that result in driveability problems. A DTC may not be displayed for the following conditions. However, problems with these systems

may cause a DTC to be displayed for other systems. For example, a fuel pressure problem will not register a DTC directly, but could cause a rich or lean condition. This could cause an oxygen sensor, fuel system, or misfire monitor DTC to be stored in the PCM.

Engine Timing – The PCM cannot detect an incorrectly indexed timing chain, camshaft sprocket, or crankshaft sprocket. The PCM also cannot detect an incorrectly indexed distributor.(*)

Fuel Pressure – Fuel pressure is controlled by the fuel pressure regulator. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line filter, or a pinched fuel supply.(*)

Fuel Injectors – The PCM cannot detect if a fuel injector is clogged, the pintle is sticking, or the wrong injectors are installed.(*)

Fuel Requirements – Poor quality gasoline can cause problems such as hard starting, stalling, and stumble. Use of methanol-gasoline blends may result in starting and driveability problems. (See individual symptoms and their definitions in Section 6.0 (Glossary of Terms).

PCM Grounds – The PCM cannot detect a poor system ground. However, a diagnostic trouble code may be stored in the PCM as a result of this condition.

Throttle Body Air Flow – The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.(*)

Exhaust System – The PCM cannot detect a plugged, restricted, or leaking exhaust system.(*)

Cylinder Compression – The PCM cannot detect uneven, low, or high engine cylinder compression.(*)

Excessive Oil Consumption – Although the PCM monitors the exhaust stream oxygen content through the oxygen sensor when the system is in a closed loop, it cannot determine excessive oil consumption.

(*NOTE: Any of these conditions could result in a rich or lean condition causing an oxygen sensor DTC to be stored in the PCM, or the vehicle may exhibit one or more of the driveability symptoms listed in the Table of Contents.

3.2.7 SKIS OVERVIEW

The Sentry Key Immobilizer System (SKIS) is an immobilizer system design to prevent unauthorized vehicle operation. The system consists of a Sentry Key Immobilizer Module (SKIM), ignition key(s) equipped with a transponder chip and engine controller. When the ignition switch is turned on, the SKIM interrogates the ignition key. If the ignition key is "Valid" or "Invalid" the SKIM sends a CCD Bus message to the engine controller indicating ignition key status valid ignition key. Upon receiv-

GENERAL INFORMATION

ing this message the PCM will terminate engine operation or allow the engine to continue to operate.

3.2.8 SKIM ON-BOARD DIAGNOSTICS

The SKIM has been programmed to transmit and monitor many different coded messages as well as CCD Bus messages. This monitoring is called “On Board Diagnosis”.

Certain criteria must be met for a diagnostic trouble code to be entered into the SKIM memory. The criteria may be a range of; Input voltage, CCD Bus message, or coded messages to the SKIM. If all of the criteria for monitoring a circuit or function are met and a fault is sensed, a DTC will be stored in the SKIM memory.

3.2.9 SKIS OPERATION

When ignition power is supplied to the SKIM, the SKIM performs an internal self-test. After the self-test is completed, the SKIM energizes the antenna (this activates the transponder chip) and sends a challenge to the transponder chip. The transponder chip responds to the challenge by generating an encrypted response message using the following:

Secret Key - This is an electronically stored value (identification number) that is unique to each SKIS. The secret key is stored in the SKIM, PCM and all ignition key transponders.

Challenge - This is a random number that is generated by the SKIM at each ignition key cycle.

The secret key and challenge are the two variables used in the algorithm that produces the encrypted response message. The transponder uses the crypto algorithm to receive, decode and respond to the message sent by the SKIM. After responding to the coded message, the transponder sends a transponder I.D. message to the SKIM. The SKIM compares the transponder I.D. to the available valid key codes in the SKIM memory (8 key maximum). After validating the ignition key the SKIM sends CCD Bus message called a “Seed Request” to the engine controller then waits for a PCM response. If the PCM does not respond, the SKIM will send the seed request again. After three failed attempts the SKIM will stop sending the seed request and store a trouble code. If the PCM sends a seed response, the SKIM sends a valid/invalid key message to the PCM. This is an encrypted message that is generated using the following:

VIN - Vehicle Identification Number

Seed - This is a random number that is generated by the PCM at each ignition key cycle.

The VIN and seed are the two variables used in the rolling code algorithm that encrypts the “valid/invalid key” message. The PCM uses the rolling code algorithm to receive, decode and respond to the valid/invalid key message sent by the SKIM. After sending the valid/invalid key message the SKIM waits 3.5 seconds for a PCM status message from the PCM. If the PCM does not respond with a valid key message to the SKIM, a fault is detected and a trouble code is stored.

The SKIS incorporates a warning lamp located in the instrument cluster. The lamp receives power and ground from the instrument cluster. The lamp is actuated when the SKIM sends a CCD Bus message to the instrument cluster requesting the lamp on. The SKIM will request lamp operation for the following:

- bulb checks at ignition on
- to alert the vehicle operator to a SKIS malfunction
- customer key programming mode

For all faults except transponder faults and VIN mismatch, the lamp remains on steady. In the event of a transponder fault the light flashes at a rate of 1 Hz (once per second). If a fault is present the lamp will remain on or flashing for the complete ignition cycle. If a fault is stored in SKIM memory which prevents the system from operating properly, the PCM will allow the engine to start and run (for 2 seconds) up to six times. After the sixth attempt, the PCM will not allow the engine to start.

3.2.10 PROGRAMMING THE POWERTRAIN CONTROL MODULE

Important Note: Before replacing the PCM for a failed driver, control circuit or ground circuit, be sure to check the related component/circuit integrity for failures not detected due to a double fault in the circuit. Most PCM driver/control circuit failures are caused by internal failure to components (i.e. relay and solenoids) and short circuits (i.e. 12-volt pull-ups, drivers and ground sensors). These failures are difficult to detect when a double fault has occurred and only one DTC has set.

NOTE: IF THE PCM AND THE SKIM ARE REPLACED AT THE SAME TIME, PROGRAM THE VIN INTO THE PCM FIRST. ALL VEHICLE KEYS WILL THEN NEED TO BE REPLACED AND PROGRAMMED TO THE NEW SKIM.

The SKIS “Secret Key” is an I.D. code that is unique to each SKIS. This code is programmed and

stored in the SKIM, engine controller and transponder chip (ignition key). When replacing the PCM it is necessary to program the secret key into the PCM.

1. Turn the ignition on (transmission in park/neutral).
2. Use the DRBIII® and select "THEFT ALARM", "SKIM" then "MISCELLANEOUS".
3. Select "PCM REPLACED".
4. Enter secured access mode by entering the vehicle four-digit PIN.

NOTE: IF THREE ATTEMPTS ARE MADE TO ENTER THE SECURE ACCESS MODE USING AN INCORRECT PIN, SECURED ACCESS MODE WILL BE LOCKED OUT FOR ONE HOUR. TO EXIT THIS LOCKOUT MODE, TURN THE IGNITION TO THE RUN POSITION FOR ONE HOUR THEN ENTER THE CORRECT PIN. (ENSURE ALL ACCESSORIES ARE TURNED OFF. ALSO MONITOR THE BATTERY STATE AND CONNECT A BATTERY CHARGER IF NECESSARY).

5. Press "ENTER" to transfer the secret key (the SKIM will send the secret key to the PCM).

3.2.11 PROGRAMMING THE SENTRY KEY IMMOBILIZER MODULE

NOTE: IF THE PCM AND THE SKIM ARE REPLACED AT THE SAME TIME, PROGRAM THE VIN INTO THE PCM FIRST. ALL VEHICLE KEYS WILL THEN NEED TO BE REPLACED AND PROGRAMMED TO THE NEW SKIM.

1. Turn the ignition on (transmission in park/neutral).
2. Use the DRBIII® and select "THEFT ALARM", "SKIM" then "MISCELLANEOUS".
3. Select "SKIM MODULE REPLACEMENT (GASOLINE)".
4. Program the vehicle four-digit PIN into the SKIM.
5. Select "COUNTRY CODE" and enter the correct country.

NOTE: BE SURE TO ENTER THE CORRECT COUNTRY CODE. IF THE INCORRECT COUNTRY CODE IS PROGRAMMED INTO SKIM, THE SKIM MUST BE REPLACED.

6. Select "UPDATE VIN" (the SKIM will learn the VIN from the PCM).
7. Press "ENTER" to transfer the secret key (the PCM will send the secret key to the SKIM).

8. The DRBIII® will ask if you want to transfer the secret key. Select "ENTER" to transfer secret key from the PCM. This will ensure the current vehicle ignition keys will still operate the SKIS system.

3.2.12 PROGRAMMING THE IGNITION KEYS TO THE SENTRY KEY IMMOBILIZER MODULE

1. Turn the ignition on (transmission in park/neutral).
2. Use the DRBIII® and select "THEFT ALARM", "SKIM", then "MISCELLANEOUS".
3. Select "PROGRAM IGNITION KEYS".
4. Enter secured access mode by entering the vehicle four-digit PIN.

NOTE: A MAXIMUM OF EIGHT KEYS CAN BE LEARNED TO EACH SKIM. ONCE A KEY IS LEARNED TO A SKIM IT (THE KEY) CANNOT BE TRANSFERRED TO ANOTHER VEHICLE.

If ignition key programming is unsuccessful, the DRB will display one of the following messages:

Programming Not Attempted - The DRBIII® attempts to read the programmed key status and there are no keys programmed in the SKIM memory.

Programming Key Failed - (Possible Used Key From Wrong Vehicle) - SKIM is unable to program key due to one of the following:

- faulty ignition key transponder
- ignition key is programmed to another vehicle.

8 Keys Already Learned, Programming Not Done - SKIM transponder ID memory is full.

1. Obtain ignition keys to be programmed from customer (8 keys maximum)
2. Using the DRBIII®, erase all ignition keys by selecting "MISCELLANEOUS" and "ERASE ALL CURRENT IGN. KEYS"
3. Program all ignition keys.

Learned Key In Ignition - Ignition key transponder ID is currently programmed in SKIM memory.

3.3 DIAGNOSTIC TROUBLE CODES

Each diagnostic trouble code is diagnosed by following a specific testing procedure. The diagnostic test procedures contain step-by-step instructions for determining the cause of DTC as well as no trouble code problems. It is not necessary to perform all of the tests in this book to diagnose an individual DTC.

GENERAL INFORMATION

Always begin by reading the diagnostic trouble codes using the DRBIII®.

3.3.1 HARD CODE

A diagnostic trouble code that comes back within one cycle of the ignition key is a “hard” code. This means that the defect is there every time the powertrain control module checks that circuit or function. Procedures in this manual verify if the DTC is a hard code at the beginning of each test. When it is not a hard code, an “intermittent” test must be performed.

DTC's that are for Euro Stage III OBD monitors will not set with just the ignition key on. Comparing these to non-emission DTC's, they will seem like an intermittent. These DTC's require a set of parameters to be performed (The DRBIII® pre-test screens will help with this for MONITOR DTC's), this is called a “TRIP”. All Euro Stage III OBD DTCs will be set after one or in some cases two trip failures, and the MIL will be turned on. These DTC's require three successful, no failures, TRIPS to extinguish the MIL, followed by 40 warm-up cycles to erase the DTC. For further explanation of TRIPS, Pre-test screens, Warm-up cycles, and the use of the DRBIII®, refer to the On Board Diagnostic training booklet #81-699-97094.

3.3.2 INTERMITTENT CODE

A diagnostic trouble code that is not there every time the PCM checks the circuit is an “intermittent” DTC. Most intermittent DTC's are caused by wiring or connector problems. Defects that come and go like this are the most difficult to diagnose; they must be looked for under specific conditions that cause them. The following checks may assist you in identifying a possible intermittent problem:

- Visually inspect related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.
- Visually inspect the related harnesses. Look for chafed, pierced, or partially broken wire.
- Refer to any technical service bulletins that may apply.
- Use the DRBIII® data recorder or co-pilot.

3.3.3 DISTANCE SINCE MI SET

The Euro Stage III OBD directive requires that the distance traveled by the vehicle while the **MI** is

activated must be available at any instant through the serial port on the standard data link connector. This feature works as follows:

1. If the MI is illuminated due to a fault, the distance count is updated (i.e. it is counting).
2. If there is a “stale” MI fault (i.e. the fault is still frozen in memory but the MI has been extinguished due to 3 good trips), the distance count is held (i.e. frozen).
3. If the distance count is being held due to (Item 2.) and the fault is cleared, the distance is cleared (set to zero).
4. If the distance count is being held due to (Item 2.) and another MI occurs, the distance count is reset (to 0) and begins updating anew.
5. If a fault occurs while the MI is already illuminated due to a previous fault (the distance count is updating), then the distance count continues to update w/out interruption.
6. If the MI is flashing due to active misfire and there is an “active” fault (i.e. matured fault for which 3 good trips have not occurred), the distance count behaves as the MI in ON.
7. If the MI is flashing due to active misfire and there is no “active” fault (i.e. the MI is flashing for a 1 malf.), the distance count behaves as if the MI is off (because it is not yet a matured fault).
8. The distance count is cleared whenever the fault is cleared. (Via 40 warm up cycles, or via scan tool).

3.3.4 HANDLING NO DTC PROBLEMS

Symptom checks cannot be used properly unless the driveability problem characteristic actually happens while the vehicle is being tested.

Select the symptom that most accurately describes the vehicle's driveability problem and then perform the test routine that pertains to this symptom. Perform each routine test in sequence until the problem is found. For definitions, see Section 6.0 Glossary Of Terms.

SYMPTOM	DIAGNOSTIC TEST
HARD START	CHECKING THE FUEL PRESSURE CHECKING COOLANT SENSOR CALIBRATION CHECKING THROTTLE POSITION SENSOR CALIBRATION CHECKING MAP SENSOR CALIBRATION CHECKING THE MINIMUM IDLE AIR FLOW CHECKING IDLE AIR CONTROL MOTOR OPERATION CHECKING EVAP EMISSION SYSTEM CHECKING IAT SENSOR
START AND STALL	CHECKING PCM POWER AND GND CKT CHECKING THE FUEL PRESSURE CHECKING COOLANT SENSOR CALIBRATION CHECKING THROTTLE POSITION SENSOR CALIBRATION CHECKING MAP SENSOR CALIBRATION CHECKING THE MINIMUM IDLE AIR FLOW CHECKING IDLE AIR CONTROL MOTOR OPERATION
HESITATION/SAG/STUMBLE	CHECKING PCM POWER AND GND CKT CHECKING THE FUEL PRESSURE CHECKING COOLANT SENSOR CALIBRATION CHECKING THROTTLE POSITION SENSOR CALIBRATION CHECKING MAP SENSOR CALIBRATION CHECKING THE MINIMUM IDLE AIR FLOW CHECKING IDLE AIR CONTROL MOTOR OPERATION CHECKING EVAP EMISSION SYSTEM CHECKING IAT SENSOR
ENGINE STALLS IN GEAR	CHECK TCC OPERATION
SURGE	CHECKING PCM POWER AND GND CKT CHECKING THE FUEL PRESSURE CHECKING COOLANT SENSOR CALIBRATION CHECKING THROTTLE POSITION SENSOR CALIBRATION CHECKING MAP SENSOR CALIBRATION CHECKING THE MINIMUM IDLE AIR FLOW CHECKING IDLE AIR CONTROL MOTOR OPERATION CHECKING EVAP EMISSION SYSTEM
LACK OF POWER/SLUGGISH	CHECKING PCM POWER AND GND CKT CHECKING THE FUEL PRESSURE CHECKING COOLANT SENSOR CALIBRATION CHECKING THROTTLE POSITION SENSOR CALIBRATION CHECKING MAP SENSOR CALIBRATION CHECKING THE MINIMUM IDLE AIR FLOW CHECKING IDLE AIR CONTROL MOTOR OPERATION

GENERAL INFORMATION

SYMPTOM	DIAGNOSTIC TEST
SPARK KNOCK/DETONATION	CHECKING PCM POWER AND GND CKT CHECKING THE FUEL PRESSURE CHECKING COOLANT SENSOR CALIBRATION CHECKING THROTTLE POSITION SENSOR CALIBRATION CHECKING MAP SENSOR CALIBRATION CHECKING THE MINIMUM IDLE AIR FLOW CHECKING IDLE AIR CONTROL MOTOR OPERATION CHECKING EVAP EMISSION SYSTEM

3.3.5 NO START INFORMATION

IMPORTANT NOTE:

If the Powertrain Control Module has been changed and the correct VIN and mileage have not been programmed, a DTC will be set in the ABS and Air bag modules. In addition, if the vehicle is equipped with a Sentry Key Immobilizer Module (SKIM), Secret Key data must be updated to enable starting.

FOR ABS AND AIR BAG SYSTEMS:

1. Enter correct VIN and Mileage in PCM.
2. Erase DTC's in ABS and Air Bag modules.

FOR SKIM THEFT ALARM:

1. Connect the DRBIII® to the data link connector.
2. Go to Theft Alarm, SKIM, Misc. and place the SKIM in *secured access* mode, by using the appropriate PIN code for this vehicle.
3. Select Update the Secret Key data, data will be transferred from the SKIM to the PCM (This is required to allow the vehicle to start with the new PCM).
4. If three attempts are made to enter *secured access* mode using the incorrect PIN, *secured access* mode will be locked out for one hour. To exit this lock out mode, leave the ignition key in the Run/Start position for one hour. Ensure all accessories are turned off. Also monitor the battery state and connect a battery charger if necessary.

3.4 USING THE DRBIII®

Refer to the DRBIII® user's guide for instructions and assistance with reading DTC's, erasing DTC's, and other DRBIII® functions.

3.5 DRBIII® ERROR MESSAGES AND BLANK SCREEN

Under normal operation, the DRBIII® will display one of only two error messages:

- User-Requested WARM Boot by pressing MORE and NO at the same time.

```
ver: 2.29
date: 1 Oct93
file: key_itf.cc
date: Jan 12 1994
line: 544
err: 0x1
User-Requested WARM Boot
```

Press MORE to switch between this display and the application screen.
Press F4 when done noting information.

or User-Requested COLD Boot by pressing MORE and YES at the same time.

```
ver: 2.29
date: 1 Oct99
file: key_hndi.cc
date: Mar 8 2000
line: 1297
err: 0x1
User-Requested COLD Boot
```

Press MORE to switch between this display and the application screen.
Press F4 when done noting information.

3.5.1 DRBIII® DOES NOT POWER UP

If the LED's do not light or no sound is emitted at start up, check for loose cable connections or a bad cable. Check the vehicle battery voltage (data link connector cavity 16). Check for proper ground connection at DLC cavity 4. A minimum of 11 volts is required to adequately power the DRBIII®.

If all connections are proper between the DRBIII® and the vehicle or other devices, and the vehicle battery is fully charged, and inoperative DRBIII® may be the result of faulty cable or vehicle wiring. For a blank screen, refer to the appropriate body diagnostics manual.

3.5.2 DISPLAY IS NOT VISIBLE

Low temperatures will affect the visibility of the display. Adjust the contrast to compensate for this condition

GENERAL INFORMATION

4.0 DISCLAIMERS, SAFETY, WARNINGS

4.1 DISCLAIMERS

All information, illustrations, and specifications contained in this manual are based on the latest information available at the time of publication. The right is reserved to make changes at any time without notice.

4.2 SAFETY

4.2.1 TECHNICIAN SAFETY INFORMATION

WARNING: ENGINES PRODUCE CARBON MONOXIDE THAT IS ODORLESS, CAUSES SLOWER REACTION TIME, AND CAN LEAD TO SERIOUS INJURY. WHEN THE ENGINE IS OPERATING, KEEP SERVICE AREAS WELL VENTILATED OR ATTACH THE VEHICLE EXHAUST SYSTEM TO THE SHOP EXHAUST REMOVAL SYSTEM.

Set the parking brake and block the wheels before testing or repairing the vehicle. It is especially important to block the wheels on front-wheel drive vehicles; the parking brake does not hold the drive wheels.

When servicing a vehicle, always wear eye protection, and remove any metal jewelry such as watchbands or bracelets that might make an inadvertent electrical contact.

When diagnosing a powertrain system problem, it is important to follow approved procedures where applicable. These procedures can be found in service manual procedures. Following these procedures is very important to the safety of individuals performing diagnostic tests.

4.2.2 VEHICLE PREPARATION FOR TESTING

Make sure the vehicle being tested has a fully charged battery. If it does not, false diagnostic codes or error messages may occur.

4.2.3 SERVICING SUB ASSEMBLIES

Some components of the powertrain system are intended to be serviced in assembly only. Attempting to remove or repair certain system sub-components may result in personal injury and/or improper system operation. Only those components with approved repair and installation procedures in the service manual should be serviced.

4.2.4 DRBIII® SAFETY INFORMATION

WARNING: EXCEEDING THE LIMITS OF THE DRB MULTIMETER IS DANGEROUS. IT CAN EXPOSE YOU TO SERIOUS INJURY. CAREFULLY READ AND UNDERSTAND THE CAUTIONS AND THE SPECIFICATION LIMITS.

Follow the vehicle manufacturer's service specifications at all times.

- Do not use the DRBIII® if it has been damaged.
- Do not use the test leads if the insulation is damaged or if metal is exposed.
- To avoid electrical shock, do not touch the test leads, tips, or the circuit being tested.
- Choose the proper range and function for the measurement. Do not try voltage or current measurements that may exceed the rated capacity.

- Do not exceed the limits shown in the table below:

FUNCTION	INPUT LIMIT
Volts	0 - 500 peak volts AC 0 - 500 volts DC
Ohms (resistance)*	0 - 1.12 megohms
Frequency Measured Frequency Generated	0 - 10 kHz
Temperature	-58 - 1100°F -50 - 600°C

* Ohms cannot be measured if voltage is present. Ohms can be measured only in a non-powered circuit.

- Voltage between any terminal and ground must not exceed 500v DC or 500v peak AC.
- Use caution when measuring voltage above 25v DC or 25v AC.
- The circuit being tested must be protected by a 10A fuse or circuit breaker.
- Use the low current shunt to measure circuits up to 10A. Use the high current clamp to measure circuits exceeding 10A.
- When testing for the presence of voltage or current, make sure the meter is functioning correctly. Take a reading of a known voltage or current before accepting a zero reading.
- When measuring current, connect the meter in series with the load.
- Disconnect the live test lead before disconnecting the common test lead.
- When using the meter function, keep the DRBIII® away from spark plug or coil wires to avoid measuring error from outside interference.

4.3 WARNINGS AND CAUTIONS

4.3.1 ROAD TEST WARNINGS

Some complaints will require a test drive as part of the repair verification procedure. The purpose of the test drive is to try to duplicate the diagnostic code or symptom condition.

CAUTION: BEFORE ROAD TESTING A VEHICLE, BE SURE THAT ALL COMPONENTS ARE REASSEMBLED. DURING THE TEST DRIVE, DO NOT TRY TO READ THE DRBIII® SCREEN WHILE IN MOTION. DO NOT HANG THE DRBIII® FROM THE REAR VIEW MIRROR OR OPERATE IT YOURSELF. HAVE AN ASSISTANT AVAILABLE TO OPERATE THE DRBIII®.

4.3.2 VEHICLE DAMAGE CAUTIONS

Before disconnecting any control module, make sure the ignition is "off". Failure to do so could damage the module.

When testing voltage or continuity at any control module, use the terminal side (not the wire end) of the connector. Do not probe a wire through the insulation; this will damage it and eventually cause it to fail because of corrosion.

Be careful when performing electrical tests so as to prevent accidental shorting of terminals. Such mistakes can damage fuses or components. Also, a second DTC could be set, making diagnosis of the original problem more difficult.

5.0 REQUIRED TOOLS AND EQUIPMENT

DRBIII® (diagnostic read-out box) scan tool
fuel pressure adapter (C-6631) or #6539
fuel pressure kit (C-4799-B) or #5069
fuel release hose (C-4799-1)
Min Air flow fitting #6714
jumper wires
ohmmeter
oscilloscope
vacuum gauge
voltmeter

12 volt test light minimum 25 ohms resistance with probe #6801

CAUTION: A 12 VOLT TEST LIGHT SHOULD NOT BE USED FOR THE FOLLOWING CIRCUITS, DAMAGE TO THE POWERTRAIN CONTROLLER WILL OCCUR.

- 5 Volt Supply
- 8 Volt Supply
- J1850 PCI Bus
- CCD Bus
- CKP Sensor Signal
- CMP Sensor Signal
- Vehicle Speed Sensor Signal
- O2 Sensor Signal

GENERAL INFORMATION

6.0 GLOSSARY OF TERMS

ABS	anti-lock brake system	lack of power, sluggish	The engine has less than expected power, with little or no increase in vehicle speed when the throttle is opened.
backfire, popback	fuel ignites in either the intake or the exhaust system	MAP	manifold absolute pressure sensor
CKP	crank position sensor	MIL	malfunction indicator lamp
CMP	camshaft position sensor	MTV	manifold tuning valve
cuts out, misses	a steady pulsation or the inability of the engine to maintain a consistent rpm	O2S	oxygen sensor
DLC	data link connector (previously called “engine diagnostic connector”)	PCI	programmable communication interface
detonation, spark knock	a mild to severe ping, especially under loaded engine conditions	PCM	powertrain control module
ECT	engine coolant temperature sensor	PCV	positive crankcase ventilation
EGR	exhaust gas recirculation valve and system	PEP	peripheral expansion port
EMCC	electronic modulated convertor clutch	poor fuel economy	There is significantly less fuel mileage than other vehicles of the same design and configuration
generator	previously called “alternator”	rough, unstable, or erratic idle stalling	The engine runs unevenly at idle and causes the engine to shake if it is severe enough. The engine idle rpm may vary (called “hunting”). This condition may cause stalling if it is severe enough.
hard start	The engine takes longer than usual to start, even though it is able to crank normally.	start & stall	The engine starts but immediately dies.
hesitation, sag, stumble	There is a momentary lack of response when the throttle is opened. This can occur at all vehicle speeds. If it is severe enough, the engine may stall.	surge	engine rpm fluctuation without corresponding change in throttle position sensor
IAT	intake air temperature sensor	TCC	torque converter clutch
IAC	idle air control motor	TPS	throttle position sensor
JTEC	Combined engine and transmission control module	TRS	transmission range sensor
		VSS	vehicle speed sensor/signal

7.0

DIAGNOSTIC INFORMATION AND PROCEDURES

Symptom:**P0622-GENERATOR FIELD NOT SWITCHING PROPERLY****When Monitored and Set Condition:****P0622-GENERATOR FIELD NOT SWITCHING PROPERLY**

When Monitored: With the ignition key on and the engine running.

Set Condition: When the PCM tries to regulate the generator field with no result during monitoring.

POSSIBLE CAUSES

GENERATOR FIELD WIRING HARNESS INTERMITTENT PROBLEM

GENERATOR FIELD WIRING HARNESS OBSERVABLE PROBLEM

GENERATOR FIELD DRIVER CIRCUIT OPEN

GENERATOR FIELD DRIVER CIRCUIT SHORTED TO GROUND

GENERATOR FIELD RESISTANCE ≥ 5.0 OHMS

GENERATOR FIELD SOURCE (+) CIRCUIT OPEN

POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, actuate the Generator Field Driver Circuit. Using a 12-volt test light, backprobe the Generator Field Driver Circuit at the back of the Generator. Did the light blink? Yes → Go To 2 No → Go To 3	All
2	Ignition on, engine not running. With the DRBIII® actuate the Generator Field Driver Circuit. Note: Actuator Test should still be running. Wiggle Wiring Harness from the Generator to PCM. With the DRBIII®, read DTC's. Does the Generator Field Driver (-) Circuit code return? Yes → Repair as necessary where wiggling caused problem to appear. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Test Complete.	All

P0622-GENERATOR FIELD NOT SWITCHING PROPERLY — Continued

TEST	ACTION	APPLICABILITY
3	<p>Ignition on, engine not running. Record all DTC's and freeze frame data, now erase Codes. Carefully inspect all Connectors for corrosion or spread Terminals before continuing. With the DRBIII® actuate the Generator Field Driver Circuit. Backprobe the Generator Field Source (+) Circuit at back of Generator. Is the voltage above 10.0 volts?</p> <p>Yes → Go To 4</p> <p>No → Repair the open Generator Field Source (+) Circuit from Generator. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p>	All
4	<p>Turn the ignition off. Disconnect the PCM harness connector(s). Disconnect the Generator Field harness connector. Measure the Generator Field Driver Circuit from PCM Connector to ground. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the Generator Field Driver Circuit shorted to ground. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the Generator Field harness connector. Note: Check Connectors - Clean/repair as necessary. Measure the Generator Field Driver Circuit from PCM to Generator. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 6</p> <p>No → Repair the open Generator Field Driver Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p>	All
6	<p>Turn the ignition off. Disconnect the Generator Field harness connector at back of the Generator. Note: Check connectors - Clean/repair as necessary. Measure resistance across the Generator Field Terminals at the Generator. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the Generator as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p> <p>No → Go To 7</p>	All
7	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Powertrain Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p>	All

Symptom:

P1492-AMBIENT/BATT TEMP SEN VOLTS TOO HIGH

When Monitored and Set Condition:

P1492-AMBIENT/BATT TEMP SEN VOLTS TOO HIGH

When Monitored: With the ignition key on.

Set Condition: The PCM senses the voltage from the AMBIENT/BATT temperature sensor to be above 4.9 volts for 3 seconds.

POSSIBLE CAUSES

SENSOR GROUND CIRCUIT OPEN
 AMBIENT/BATT SIGNAL CIRCUIT SHORTED TO VOLTAGE
 AMBIENT/BATT SIGNAL CIRCUIT OPEN
 AMBIENT/BATT TEMPERATURE SENSOR
 PCM
 WIRING HARNESS INTERMITTENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the DTC Good Trip Counter displayed and equal to zero for P1492? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Disconnect the AMBIENT/BATT Temperature Sensor harness connector. Measure the resistance between the Sensor Ground circuit and ground at the AMBIENT/BATT Temperature Sensor connector. Is the resistance below 5.0 ohms? No → Repair the open Sensor Ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 3. Yes → Go To 3	All
3	Turn the ignition off. Disconnect the AMBIENT/BATT connector. Start the engine. Allow engine to idle. Measure the AMBIENT/BATT Signal circuit voltage at the AMBIENT/BATT connector. Is the voltage above 5.5 volts? Yes → Repair the short to voltage. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Go To 4	All

P1492-AMBIENT/BATT TEMP SEN VOLTS TOO HIGH — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the AMBIENT/BATT connector. Disconnect the PCM harness connector(s). Measure the resistance of the AMBIENT/BATT Signal circuit from the AMBIENT/BATT connector to the PCM connector. Is the resistance below 5.0 ohms?</p> <p>No → Repair the open circuit. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p> <p>Yes → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the AMBIENT/BATT Temperature Sensor connector. Turn the ignition on. With the DRBIII® in sensors, read the "Ambient/Bat Tmp Vlt" value. Connect a jumper wire between the AMB/BATT Signal circuit and the Sensor Ground circuit at the AMB/BATT connector. Voltage should change from greater than 4.5 volts to less than 1.0 volt. Did the "Ambient/Bat Tmp Vlt" value change from greater than 4.5 volts to less than 1.0 volt?</p> <p>Yes → Replace the AMBIENT/BATT Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p> <p>No → Go To 6</p>	All
6	<p>If there are no possible causes remaining, view repair. View repair options.</p> <p>Repair Replace the PCM. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p>	All
7	<p>Turn the ignition off. Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Note: Refer to any Technical Service Bulletins (TSB) that may apply. Perform a wiggle test on the related wiring harnesses with the engine running. Were any problems found?</p> <p>Yes → Repair wiring harness/connectors as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p> <p>No → Test Complete.</p>	All

Symptom:

P1493-AMBIENT/BATT TEMP SEN VOLTS TOO LOW

When Monitored and Set Condition:

P1493-AMBIENT/BATT TEMP SEN VOLTS TOO LOW

When Monitored: With the ignition on.

Set Condition: The PCM senses the voltage from the AMBIENT/BATT temperature sensor to be below 0.5 volt for 3 seconds.

POSSIBLE CAUSES

AMBIENT/BATT TEMP SENSOR SIGNAL CIRCUIT SHORTED TO THE SENSOR GROUND CIRCUIT

AMBIENT/BATT TEMPERATURE SIGNAL CIRCUIT SHORTED TO GROUND

AMBIENT/BATT TEMPERATURE SENSOR

PCM

WIRING HARNESS INTERMITTENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the DTC Specific Good Trip Counter displayed and equal to zero for P1493? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition on. With the DRBIII® in sensors, read the "Ambient/Bat Tmp Vlt" value. Disconnect the AMBIENT/BATT Temperature Sensor connector. Did the "Ambient/Bat Tmp Vlt" value change from below 1.0 volt to above 4.5 volts? Yes → Replace the AMBIENT/BATT Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Go To 3	All
3	Turn the ignition off. Disconnect the AMBIENT/BATT connector. Disconnect the PCM harness connector(s). Measure the AMBIENT/BATT temperature sensor Signal circuit to ground. Is the resistance below 5.0 ohms? Yes → Repair the short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Go To 4	All

P1493-AMBIENT/BATT TEMP SEN VOLTS TOO LOW — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the AMBIENT/BATT temperature sensor connector. Disconnect the PCM harness connectors.</p> <p>Measure the resistance between the AMBIENT/BATT temperature sensor Signal circuit and the Sensor Ground circuit.</p> <p>Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the shorted circuit. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p> <p>No → Go To 5</p>	All
5	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the PCM.</p> <p>Perform POWERTRAIN VERIFICATION TEST VER - 3.</p>	All

Symptom:

P1594-CHARGING SYSTEM VOLTAGE TOO HIGH

When Monitored and Set Condition:

P1594-CHARGING SYSTEM VOLTAGE TOO HIGH

When Monitored: With the ignition key on and the engine speed greater than 0 RPM.

Set Condition: When the PCM regulates the generator field and there are no detected field problems, but the voltage output does not decrease.

POSSIBLE CAUSES

AMBIENT/BATT TEMPERATURE SENSOR
 GENERATOR FIELD DRIVER CIRCUIT SHORTED TO GROUND
 GENERATOR FIELD SHORTED TO GROUND
 AMBIENT/BATT TEMPERATURE SENSOR
 POWERTRAIN CONTROL MODULE (BATTERY VOLTAGE)
 POWERTRAIN CONTROL MODULE (GENERATOR RESISTANCE)

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, actuate the Generator Field Driver. With a 12-volt test light, backprobe the Generator Field Driver Circuit in back of Generator. Did the light blink? Yes → Go To 2 No → Go To 6	All
2	Ignition on, engine not running. With the DRBIII®, actuate the Generator Field Driver. With DRBIII®, stop the Generator Field Driver actuation. With DRBIII®, read the Target Charging voltage. Is the Target Charging voltage above 0 volts? Yes → Go To 3 No → Go To 4	All
3	Start the engine. Manually set the engine speed to 1600 RPM. With DRBIII®, read both the Battery voltage and the Target Charging voltage. Compare the "Target Voltage" to the "Battery Voltage" reading. Monitor voltage for 5 minutes, if necessary. Look for a 1.0 volt difference or more. Was there more than a 1.0 volt difference? Yes → Replace the Powertrain Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Test Complete.	All

P1594-CHARGING SYSTEM VOLTAGE TOO HIGH — Continued

TEST	ACTION	APPLICABILITY
4	Ignition on, engine not running. .With the DRBIII® in Inputs/Outputs, read the AMBIENT/BATT temperature. Using a thermometer measure under hood temperature near Battery tray. Is the temperature within 10 deg of Battery temperature? Yes → Go To 5 No → Replace AMBIENT/BATT Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 3.	All
5	If there are no possible causes remaining, view repair. Repair Replace the AMBIENT/BATT TEMP SENSOR. Perform POWERTRAIN VERIFICATION TEST VER - 3.	All
6	Turn the ignition off. Disconnect the PCM harness connector(s). Disconnect the Generator Field harness connector. Measure the Generator Field Driver Circuit from PCM Harness Connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the Generator Field Driver Circuit shorted to ground. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Go To 7	All
7	Turn the ignition off. Disconnect the Field Harness Connector at back of the Generator. Note: Check connectors - Clean/repair as necessary. Measure resistance of the Generator Field Driver Circuit at the Generator to Ground. Is the resistance below 5.0 ohms? Yes → Repair or replace the shorted Generator as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Go To 8	All
8	If there are no possible causes remaining, view repair. Repair Replace the Powertrain Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 3.	All

Symptom:

P1682-CHARGING SYSTEM VOLTAGE TOO LOW

When Monitored and Set Condition:

P1682-CHARGING SYSTEM VOLTAGE TOO LOW

When Monitored: With the ignition key on and the engine running over 1500 RPM after 25 seconds.

Set Condition: When the PCM regulates the generator field and there are no detected field problems, but the voltage output does not increase.

POSSIBLE CAUSES

AMBIENT/BATT TEMPERATURE SENSOR

B (+) CIRCUIT HIGH RESISTANCE

GENERATOR GROUND HIGH RESISTANCE

GENERATOR FIELD DRIVER CIRCUIT OPEN

GENERATOR FIELD DRIVER CIRCUIT SHORTED TO GROUND

GENERATOR FIELD SOURCE CIRCUIT SHORTED TO GROUND

GENERATOR FIELD SOURCE (+) CIRCUIT OPEN

PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Note: Battery must be fully charged. Note: Generator Belt tension and condition must be checked before continuing. Start the engine. With the DRBIII®, read the target charging voltage. Is the target charging voltage above 15.1 volts? Yes → Go To 2 No → Go To 9	All
2	Turn the ignition off. Note: Battery must be fully charged. Note: Generator Belt tension and condition must be checked before continuing. Start the engine. Allow the engine to reach normal operating temperature. With the DRBIII® in Inputs/Outputs, read the AMBIENT/BATT Temperature. Using a Thermometer, measure under hood temperature. Is the temperature within 10 F degrees of Battery temperature? Yes → Go To 9 No → Go To 3	All

P1682-CHARGING SYSTEM VOLTAGE TOO LOW — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the AMBIENT/BATT harness Connector. Note: Check connectors - Clean/repair as necessary. Connect a jumper across the Terminals of the AMBIENT/BATT (harness side). Ignition on, engine not running. With the DRBIII® in Inputs/Outputs, read the AMBIENT/BATT voltage. Is the voltage reading equal to zero?</p> <p>Yes → Replace the AMBIENT/BATT temperature sensor. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p> <p>No → Go To 4</p>	All
4	<p>Ignition on, engine not running. Record all DTC's and freeze frame data, now erase Codes. Carefully inspect all Connectors for corrosion or spread Terminals before continuing. With the DRBIII® actuate the Generator Field Driver Circuit. Backprobe the Generator Field Source (+) Circuit at back of Generator. Is the voltage above 10.0 volts?</p> <p>Yes → Go To 5</p> <p>No → Repair the open Generator Field Source (+) Circuit from Generator. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p>	All
5	<p>Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the Generator Field harness connector. Note: Check Connectors - Clean/repair as necessary. Measure the Generator Field Driver Circuit from PCM to Generator. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 6</p> <p>No → Repair the open Generator Field Driver Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p>	All
6	<p>Turn the ignition off. Disconnect the PCM harness connector(s). Disconnect the generator field harness connector. Measure the Generator Field Source Circuit from PCM harness connector to ground. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the Generator Field Source Circuit shorted to ground and replace PCM. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p> <p>No → Go To 7</p>	All
7	<p>Turn the ignition off. Disconnect the PCM harness connector(s). Disconnect the Generator Field harness connector. Measure the Generator Field Driver Circuit from PCM Connector to ground. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the Generator Field Driver Circuit shorted to ground. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p> <p>No → Go To 8</p>	All

P1682-CHARGING SYSTEM VOLTAGE TOO LOW — Continued

TEST	ACTION	APPLICABILITY
8	<p>Start the engine. Warm the engine to operating temperature. Caution: Ensure all wires are clear of the engine's moving parts. Measure voltage between the Generator case and Battery (-) Post. Is the voltage above 0.1 volt?</p> <p>Yes → Repair Generator Ground for high resistance, Generator Case to Battery (-) side. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p> <p>No → Go To 17</p>	All
9	<p>Turn ignition on, engine not running. Measure voltage between the Generator B(+) Terminal and the Battery (+) Post. Caution: Ensure all wires are clear of the engine's moving parts. Start the engine. Is the voltage above 0.4 volt?</p> <p>Yes → Repair the B(+) Circuit for high resistance between the Generator and Battery. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p> <p>No → Go To 10</p>	All
10	<p>Start the engine. Warm the engine to operating temperature. Caution: Ensure all wires are clear of the engine's moving parts. Measure voltage between the Generator case and Battery (-) Post. Is the voltage above 0.1 volt?</p> <p>Yes → Repair Generator Ground for high resistance, Generator Case to Battery (-) side. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p> <p>No → Go To 11</p>	All
11	<p>Caution: KEEP CLEAR OF THE ENGINE'S MOVING PARTS. Start the engine. Turn on all accessories, manually set engine speed to 1600 RPM. With DRBIII®, read Target Charging and Charging voltage. Compare the two readings. Is there more than a 1.0 volt difference?</p> <p>Yes → Go To 12</p> <p>No → Test Complete.</p>	All
12	<p>Ignition on, engine not running. With the DRBIII®, actuate the Generator Field. Measure the voltage at both Generator Field Terminals. Is the voltage below 3.0 volts at either Terminal?</p> <p>Yes → Go To 13</p> <p>No → Test Complete.</p>	All

P1682-CHARGING SYSTEM VOLTAGE TOO LOW — Continued

TEST	ACTION	APPLICABILITY
13	<p>Ignition on, engine not running. Record all DTC's and freeze frame data, now erase Codes. Carefully inspect all Connectors for corrosion or spread Terminals before continuing. CHARGING

Symptom:

***CHECKING CHARGING SYSTEM OPERATION WITH NO DTC'S PRESENT**

POSSIBLE CAUSES
B (+) CIRCUIT HIGH RESISTANCE GENERATOR GROUND HIGH RESISTANCE B(+) CIRCUIT HIGH RESISTANCE (1.0 VOLT) GENERATOR BELT OBSERVABLE PROBLEM GENERATOR FIELD TERMINAL INTERMITTENT PROBLEM TROUBLE CODES PRESENT TROUBLE CODES PRESENT 2000 RPM PCM (CHARGING SYSTEM NO CODE)

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Note: Battery condition must be verified prior to this test. Inspect the Generator Belt tension and condition. Is the Generator Belt OK? Yes → Go To 2 No → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 3.	All
2	Start the engine. Turn on all accessories. Raise engine speed to 2000 RPM for 30 seconds then return to idle. With the DRBIII®, read DTC's. Are there any "Charging System" Trouble Codes? Yes → Refer to Symptom list for problems related to Charging. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Go To 3	All
3	Ignition on, engine not running. With the DRBIII®, actuate the Generator Field. Using a 12-volt test light, backprobe the Generator Field Driver Terminal at the back of the Generator. Note: The test light should blink On and Off every 1.4 seconds. While monitoring the 12-volt test light, wiggle the Field Terminals back to the PCM and ASD Relay. Was there any interruption in the normal cycle of the test light? Yes → Repair the wire where wiggling interrupted the voltage cycle. Perform POWERTRAIN VERIFICATION TEST VER - 3. No → Go To 4	All

***CHECKING CHARGING SYSTEM OPERATION WITH NO DTC'S PRESENT — Continued**

TEST	ACTION	APPLICABILITY
4	<p>Ignition on, engine not running. With the DRBIII®, read DTC's. Are there any "Charging System" trouble codes?</p> <p>Yes → Refer to Symptom list for problems related to Charging. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p> <p>No → Go To 5</p>	All
5	<p>Turn ignition on, engine not running. Measure voltage between the Generator B(+) Terminal and the Battery (+) Post. Caution: Ensure all wires are clear of the engine's moving parts. Start the engine. Is the voltage above 0.4 volt?</p> <p>Yes → Repair the B(+) Circuit for high resistance between the Generator and Battery. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p> <p>No → Go To 6</p>	All
6	<p>Start the engine. Warm the engine to operating temperature. Caution: Ensure all wires are clear of the engine's moving parts. Measure voltage between the Generator case and Battery (-) Post. Is the voltage above 0.1 volt?</p> <p>Yes → Repair Generator Ground for high resistance, Generator Case to Battery (-) side. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p> <p>No → Go To 7</p>	All
7	<p>Ignition on, engine not running. With the DRBIII®, read the Battery voltage and record the results. Measure Battery voltage B(+) to B(-) Terminal and record the results. Compare the two voltage readings. Is the voltage difference less than one volt?</p> <p>Yes → Test Complete.</p> <p>No → Go To 8</p>	All
8	<p>Ignition on, engine not running. With the DRBIII®, read the Battery voltage and record the results. Turn the Ignition off. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Ignition on, engine not running. Measure the Fused B(+) at PCM Connector. Is the voltage within one volt of the DRB recorded reading?</p> <p>Yes → Go To 9</p> <p>No → Repair the B(+) Circuit for high resistance between the PCM and the Battery. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p>	All
9	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the PCM. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p>	All

Symptom:

*CHECKING THE AMBIENT/BATTERY TEMPERATURE SENSOR

POSSIBLE CAUSES
AMBIENT/BATT TEMPERATURE SENSOR
AMBIENT/BATT (OUT OF CALIBRATION)

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. With the DRBIII® in sensors, read the "Ambient/Bat Tmp Deg" value and record the reading. Using a temp probe, measure the air temperature near the AMBIENT/BATT. Is the recorded AMBIENT/BATT temperature value within 10° of the temperature probe reading?</p> <p>Yes → Go To 2</p> <p>No → Replace the AMBIENT/BATT Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p>	All
2	<p>Turn the ignition off. Disconnect the AMBIENT/BATT harness Connector. Note: Check connectors - Clean/repair as necessary. Connect a jumper across the Terminals of the AMBIENT/BATT (harness side). Ignition on, engine not running. With the DRBIII® in Inputs/Outputs, read the AMBIENT/BATT voltage. Is the voltage reading equal to zero?</p> <p>Yes → Replace the AMBIENT/BATT temperature sensor. Perform POWERTRAIN VERIFICATION TEST VER - 3.</p> <p>No → Test Complete.</p>	All

Symptom:

P-1685 INVALID SKIM KEY

When Monitored and Set Condition:

P-1685 INVALID SKIM KEY

When Monitored: With the ignition on.

Set Condition: The PCM does not receive a valid key message from the SKIM.

POSSIBLE CAUSES

INCORRECT VIN IN PCM
INVALID SKIM KEY NOT PRESENT
NO COMMUNICATION WITH SKIM
NO VIN PROGRAMMED IN THE PCM
PCM
SKIM TROUBLE CODES SET

TEST	ACTION	APPLICABILITY
1	<p>With the DRB III, read the PCM DTCs. Look for P1685. Turn the ignition on. Is the Starts Since Set counter for DTC P1685 displayed and equal to 0?</p> <p>Yes → Go To 2 No → Go To 7</p>	All
2	<p>Turn the ignition on. With the DRB III, attempt to communicate with the SKIM. Can you communicate with the SKIM?</p> <p>Yes → Go To 3 No → Refer to symptom BUS +/- SIGNAL OPEN FROM SKIM in the COMMUNICATION category. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
3	<p>Turn the ignition on. With the DRB III, check for SKIM DTC's. Are there any trouble codes set in the SKIM?</p> <p>Yes → Repair all SKIM DTC's. Perform ROAD TEST VERIFICATION - VER-2. No → Go To 4</p>	All

P-1685 INVALID SKIM KEY — Continued

TEST	ACTION	APPLICABILITY
4	<p>NOTE: If a VIN has not been programmed into the PCM, program VIN into the PCM and retest.</p> <p>Turn the ignition on.</p> <p>With the DRB III, display the VIN that is programmed in the PCM.</p> <p>Is there a VIN programmed in the PCM?</p> <p>Yes → Go To 5</p> <p>No → Program the correct VIN into the PCM and retest. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
5	<p>Turn the ignition on.</p> <p>With the DRB III, display the VIN that is programmed in the PCM.</p> <p>Is the correct VIN programmed in the PCM?</p> <p>Yes → Go To 6</p> <p>No → Replace and program the PCM in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p>	All
6	<p>Turn the ignition off.</p> <p>Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information.</p> <p>Turn the ignition on.</p> <p>With the DRB III, erase all DTCs.</p> <p>Attempt to start and idle the engine.</p> <p>With the DRB III, read the PCM DTCs.</p> <p>Does the DRB III display this code?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Test Complete.</p>	All
7	<p>NOTE: This DTC could have been set if the SKIM harness connector was disconnected, or if the SKIM was replaced recently.</p> <p>NOTE: All keys that the customer uses for this vehicle must be tested to verify they are operating properly.</p> <p>Verify the correct VIN is programmed in both the PCM and SKIM modules.</p> <p>Turn the ignition off.</p> <p>With the next customer key turn the ignition key on and crank the engine to start.</p> <p>With the DRB III, read the PCM DTCs. Look for P1685</p> <p>Is the Starts Since Set Counter for DTC P1685 displayed and equal to 0?</p> <p>Yes → Replace the Ignition Key. Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Test Complete.</p> <p>NOTE: If this DTC can not be reset, it may have been an actual theft attempt.</p>	All

Symptom:

P-1686 NO SKIM BUS MESSAGE RECEIVED

When Monitored and Set Condition:

P-1686 NO SKIM BUS MESSAGE RECEIVED

When Monitored: With the ignition on.

Set Condition: The PCM does not receive a CCD Bus message from the SKIM when expected.

POSSIBLE CAUSES

PCM
INTERMITTENT CONDITION
CCD BUS CIRCUIT(S) OPEN FROM PCM TO SKIM
LOSS OF SKIM COMMUNICATION

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB III®, read PCM DTCs. LOOK for P1686. Is the Starts Since Set counter for DTC P1686 displayed and equal to 0? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition on. With the DRB III®, attempt to communicate with the SKIM. With the DRB III®, select Theft Alarm and read the SKIM DTCs. NOTE: This test will indicate if the Bus is operational from the DLC to the SKIM. Can the DRB communicate with the SKIM? Yes → Go To 3 No → Refer to the appropriate symptom in the COMMUNICATION category. Perform ROAD TEST VERIFICATION - VER-2.	All
3	Turn the ignition off. Disconnect the PCM harness connectors. Disconnect the SKIM harness connector. Measure the resistance of both CCD Bus circuits between the PCM and the SKIM. Is the resistance below 5.0 ohms for each measurement? Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform ROAD TEST VERIFICATION - VER-2. No → Repair the CCD Bus circuit(s) for an open. Perform ROAD TEST VERIFICATION - VER-2.	All

P-1686 NO SKIM BUS MESSAGE RECEIVED — Continued

TEST	ACTION	APPLICABILITY
4	<p>WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS.</p> <p>NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.</p> <p>With the engine running and at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set.</p> <p>Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set.</p> <p>Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Were any of the above conditions present?</p> <p>Yes → Repair as necessary Perform ROAD TEST VERIFICATION - VER-2.</p> <p>No → Test Complete.</p>	All

Symptom List:

P0600-PCM FAILURE SPI COMMUNICATIONS

P0601-PCM INTERNAL CONTROLLER FAILURE

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be P0600-PCM FAILURE SPI COMMUNICATIONS.

POSSIBLE CAUSES

PCM

TEST	ACTION	APPLICABILITY
1	<p>The Powertrain Control Module is reporting internal errors and must be replaced.</p> <p>View repair</p> <p>Repair</p> <p>Replace the Powertrain Control Module.</p> <p>Perform POWERTRAIN VERIFICATION TEST VER - 2.</p>	All

Symptom List:

P1698-NO BUS MESSAGE FROM TRANS CONTROL MODULE

P1698-NO BUS MESSAGE FROM TCM

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be **P1698-NO BUS MESSAGE FROM TRANS CONTROL MODULE**.

When Monitored and Set Condition:

P1698-NO BUS MESSAGE FROM TRANS CONTROL MODULE

When Monitored: Equipped with automatic transmission, the ignition key on, engine running, transmission in drive, vehicle road speed and battery voltage greater than 10 volts.

Set Condition: No bus messages from the TCM for 10 seconds, two trips required.

POSSIBLE CAUSES

INTERMITTENT CONDITION

COMMUNICATE WITH TCM

PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, erase DTCs. Cycle the ignition key on and off several times. With the DRBIII®, read DTC's. Does the DTC reset? Yes → Go To 2 No → Go To 3	All
2	Turn the ignition on. With the DRBIII®, attempt to communicate with the TCM. Can communication be established with the TCM? Yes → Replace and program the Powertrain Control Module Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER-1. No → Refer to the Communication Category and perform the appropriate symptom related to no communication with TCM. Perform POWERTRAIN VERIFICATION TEST VER-1.	All

P1698-NO BUS MESSAGE FROM TRANS CONTROL MODULE — Continued

TEST	ACTION	APPLICABILITY
3	<p>WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS.</p> <p>NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.</p> <p>With the engine running at normal operating temperature, monitor the DRB parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set.</p> <p>Review the DRB Freeze Frame information. If possible, try to duplicate the conditions under which the DTC was set.</p> <p>Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>Visually inspect the related wiring harness connectors. Symptom:

***NO RESPONSE FROM PCM-ENGINE STARTS (GAS ONLY)**

POSSIBLE CAUSES
ATTEMPT TO COMMUNICATE WITH ANOTHER VEHICLE
CHECK PCM POWERS AND GROUNDS
TRANSMISSION CONTROL MODULE
CONTROLLER ANTILOCK BRAKE
SCI TRANSMIT CIRCUIT SHORTED TO GROUND
SCI RECEIVE CIRCUIT SHORTED TO GROUND
SCI RECEIVE CIRCUIT OPEN
SCI TRANSMIT CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. NOTE: Make sure the vehicle starts and runs before proceeding, if not refer to the appropriate symptom for a no response and a no start condition. Connect the DRB to another vehicle. Will the DRB communicate with this vehicle? Yes → Go To 2 No → Repair or replace the DRB or DRB cable as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
2	Perform the symptom Checking PCM Power and Ground Circuits in the Driveability category. Did the vehicle pass this test? Yes → Go To 3 No → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
3	Turn the ignition off. Disconnect the PCM C3 harness connector. Disconnect the DRB from the DLC. Measure the resistance between ground and the SCI Transmit circuit. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Go To 6	All
4	Turn the ignition off. Disconnect the TCM harness connector (if equipped). Measure the resistance between ground and the SCI Transmit circuit. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Replace the Transmission Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

***NO RESPONSE FROM PCM-ENGINE STARTS (GAS ONLY) — Continued**

TEST	ACTION	APPLICABILITY
5	<p>Turn the ignition off. Disconnect the CAB harness connector (if equipped). Measure the resistance between ground and the SCI Transmit circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the SCI Transmit circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Replace the Controller Antilock Brake. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
6	<p>Turn the ignition off. Disconnect the PCM C3 harness connector. Disconnect the DRB from the DLC. Measure the resistance between ground and the SCI Receive circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the SCI Receive circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Go To 7</p>	All
7	<p>Turn the ignition off. Disconnect the PCM C3 harness connector. Disconnect the DRB from the DLC. Measure the resistance of the SCI Receive circuit between the PCM C3 connector and the DLC. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 8</p> <p>No → Repair the SCI Receive circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All

Symptom:**P0125-CLOSED LOOP TEMP NOT REACHED****When Monitored and Set Condition:****P0125-CLOSED LOOP TEMP NOT REACHED**

When Monitored: With battery voltage greater than 10.4 volts, after engine is started, for ten minutes.

Set Condition: The engine temperature does not go above 18 deg. F by 10 minutes after the engine is started. Two trips are required to set this DTC.

POSSIBLE CAUSES

ECT SENSOR (OUT OF CALIBRATION)

LOW COOLANT LEVEL

THERMOSTAT OPERATION

ECT WIRING HARNESS INTERMITTENT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTCs. Is the Good Trip Counter for P0125 displayed and equal to zero? Yes → Go To 2 No → Go To 5	All
2	NOTE: If a ECT DTC set along with this code, diagnose the ECT DTC first. NOTE: Inspect the ECT terminals and related PCM terminals. Ensure the terminals are free from corrosion and damage. NOTE: The best way to diagnose this DTC is to allow the vehicle to sit overnight outside in order to have a totally cold soaked engine. Note: Extremely cold outside ambient temperatures may have caused this DTC to set. WARNING: Never open the cooling system when the engine is hot. The system is under pressure. Extreme burns or scalding may result. Allow the engine to cool before opening the cooling system. Check the coolant system to make sure that the coolant is in good condition and at the proper level. Is the coolant level and condition OK? Yes → Go To 3 No → Inspect the vehicle for a coolant leak and add the necessary amount of coolant. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0125-CLOSED LOOP TEMP NOT REACHED — Continued

TEST	ACTION	APPLICABILITY
3	<p>Note: For this test to be valid, the thermostat must be operating correctly.</p> <p>Note: This test works best if performed on a cold engine (cold soak)</p> <p>Turn the ignition on.</p> <p>With the DRBIII® in sensors, read the Eng Coolant Tmp Deg value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the surrounding temperature (ambient temperature).</p> <p>Note: If engine coolant temperature is above 82°C (180°F), allow the engine to cool until 65°C (150°F) is reached.</p> <p>Start the engine.</p> <p>During engine warm-up, monitor the Eng Coolant Tmp Deg value. The temp deg value change should be a smooth transition from start up to normal operating temp 82°C (180°F). The value should reach at least 82°C (180°F).</p> <p>Was the Eng Coolant Tmp Deg value increase a smooth transition and did it reach at least 180°?</p> <p>Yes → Go To 4</p> <p>No → Replace the Engine Coolant Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
4	<p>Note: This test works best if performed on a cold engine (cold soak)</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, read the Eng Coolant Tmp Deg value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature.</p> <p>Note: If engine coolant temperature is above 82°C (180°F), allow the engine to cool until 65°C (150°F) is reached.</p> <p>Start the Engine.</p> <p>During engine warm-up monitor the Eng Coolant Tmp Deg value. The temp deg value change should be a smooth transition from start up to normal operating temp 82°C (180°F) . Also monitor the actual coolant temperature with a thermometer.</p> <p>NOTE: As the engine warms up to operating temperature, the actual coolant temperature (thermometer reading) and the Eng Coolant Tmp Deg in the DRBIII® values should stay relatively close to each other.</p> <p>Using the appropriate service information, determine the proper opening temperature of the thermostat.</p> <p>Did the thermostat open at the proper temperature?</p> <p>Yes → Test Complete.</p> <p>No → Replace the thermostat. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
5	<p>Turn the ignition off.</p> <p>Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>Note: Visually inspect the related wiring harness connectors. Symptom List:

P0133-1/1 O2 SENSOR SLOW RESPONSE
P0139-1/2 O2 SENSOR SLOW RESPONSE
P0153-2/1 O2 SENSOR SLOW RESPONSE
P0159-2/2 O2 SENSOR SLOW RESPONSE

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0133-1/1 O2 SENSOR SLOW RESPONSE.

When Monitored and Set Condition:**P0133-1/1 O2 SENSOR SLOW RESPONSE**

When Monitored: With ECT greater than 147°F, after reaching a vehicle speed of 10 mph, and the throttle remaining open (off idle) for 2 minutes, bring the vehicle to a stop and allow the engine to idle with the transmission in DRIVE.

Set Condition: The oxygen sensor signal voltage is switching from below 0.27 volts to above 0.62 volts and back fewer times than required.

P0139-1/2 O2 SENSOR SLOW RESPONSE

When Monitored: Start engine. Allow engine to idle. For 1st part of test, if limits are exceeded, test passes. If not, 2nd part of test runs. amb/batt temp >44°F, Baro >22.13" H2O, battery >10.5 volts, MAP >11.79 & <18.15" H2O, RPM >1350 & <2200 and vss >50 and <65.

Set Condition: The oxygen sensor signal voltage is switching from below 0.39 volts to above 0.58 volts and back fewer times than required.

P0153-2/1 O2 SENSOR SLOW RESPONSE

When Monitored: With ECT greater than 147°F, after reaching a vehicle speed of 10 mph, and the throttle remaining open (off idle) for 2 minutes, bring the vehicle to a stop and allow the engine to idle with the transmission in DRIVE.

Set Condition: The oxygen sensor signal voltage is switching from below 0.27 volts to above 0.62 volts and back fewer times than required.

P0159-2/2 O2 SENSOR SLOW RESPONSE

When Monitored: Start engine. Allow engine to idle. For 1st part of test, if limits are exceeded, test passes. If not, 2nd part of test runs. amb/batt temp >44°F, Baro >22.13" H2O, battery >10.5 volts, MAP >11.79 & <18.15" H2O, RPM >1350 & <2200 and vss >50 and <65.

Set Condition: The oxygen sensor signal voltage is switching from below 0.39 volts to above 0.58 volts and back fewer times than required.

Symptom List:

P0135-1/1 O2 SENSOR HEATER FAILURE

P0141-1/2 O2 SENSOR HEATER FAILURE

P0155-2/1 O2 SENSOR HEATER FAILURE

P0161-2/2 O2 SENSOR HEATER FAILURE

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0135-1/1 O2 SENSOR HEATER FAILURE.

When Monitored and Set Condition:

P0135-1/1 O2 SENSOR HEATER FAILURE

When Monitored: With battery voltage greater than 9 volts, at a cold start, ECT less than 147°F, battery temperature sensor equal to or less than 27°F, and engine at idle for at least 12 seconds.

Set Condition: O2 sensor voltage greater than 3 volts for 30 to 90 seconds.

P0141-1/2 O2 SENSOR HEATER FAILURE

When Monitored: With battery voltage greater than 9 volts, at a cold start, ECT less than 147°F, battery temperature sensor equal to or less than 27°F, and engine at idle for at least 12 seconds.

Set Condition: O2 sensor voltage greater than 3 volts for 60 to 240 seconds.

P0155-2/1 O2 SENSOR HEATER FAILURE

When Monitored: With battery voltage greater than 9 volts, at a cold start, ECT less than 147°F, battery temperature sensor equal to or less than 27°F, and engine at idle for at least 12 seconds.

Set Condition: O2 sensor voltage greater than 3 volts for 30 to 90 seconds.

P0161-2/2 O2 SENSOR HEATER FAILURE

When Monitored: With battery voltage greater than 9 volts, at a cold start, ECT less than 147°F, battery temperature sensor equal to or less than 27°F, and engine at idle for at least 12 seconds.

Set Condition: O2 sensor voltage greater than 3 volts for 30 to 90 seconds.

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip Counter for this DTC displayed and equal to zero? No → Go To 3 Yes → Go To 2	All
2	Turn the ignition off. NOTE: Wait a minimum of 8 minutes to allow the O2 Sensor to cool down before continuing the test. Allow the O2 Sensor voltage to stabilize between 0.4 to 0.6 volts. Turn the ignition on. With the DRBIII®, actuate the O2 Heater Test. With the DRBIII®, monitor O2 Sensor voltage for at least 2 minutes. Does the voltage stay between 0.4 and 0.6 volt? Yes → Go To 3 No → Go To 7	All
3	NOTE: Allow the O2 sensor to cool down to room temperature. Turn the ignition off. Disconnect the O2 Sensor harness connector. Measure the resistance across the O2 Sensor Heater element component side. Is the resistance between 4.0 and 7.0 ohms? Yes → Go To 4 No → Replace the O2 Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
4	Turn the ignition off. Disconnect the O2 Sensor harness connector. Measure the resistance of the O2 Sensor Heater ground circuit in the O2 Sensor harness connector. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair the O2 Sensor Heater ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition off. Disconnect the O2 Sensor harness connector. With the DRBIII®, actuate the O2 Heater Test. Measure the voltage of the O2 Heater Relay Output circuit in the O2 Sensor harness connector. Is the voltage above 11.0 volts? Yes → Go To 6 No → Repair the O2 Heater Relay Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

TEST	ACTION	APPLICABILITY
10	<p>Turn the ignition off. Connect a Vacuum Gauge to a Manifold Vacuum source. Start the engine. Allow the engine to idle. Note: If engine will not idle, maintain a constant RPM above idle. With the DRBIII® in Sensors, read the MAP Sensor vacuum value. Is the DRBIII® reading within 1" of the Vacuum Gauge reading?</p> <p>Yes → Go To 11</p> <p>No → Replace the MAP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
11	<p>Note: For this test to be valid, the thermostat must be operating correctly. Note: This test works best if performed on a cold engine (cold soak) Turn the ignition on. With the DRBIII®, read the Engine Coolant Temperature Sensor value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature. Note: If engine coolant temperature is above 82°C (180°F), allow the engine to cool until 65°C (150°F) is reached. Start the Engine. During engine warm-up, monitor the Engine Coolant Temperature value. The temp value change should be a smooth transition from start up to normal operating temp 82°C (180°F). The value should reach at least 82°C (180°F). Did the Engine Coolant Temperature increase smoothly and did it reach at least 82°C (180°F)?</p> <p>Yes → Go To 12</p> <p>No → Replace the Engine Coolant Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
12	<p>Check for any of the following conditions/mechanical problems. AIR INDUCTION SYSTEM - must be free from leaks. ENGINE VACUUM - must be at least 13 inches in neutral ENGINE VALVE TIMING - must be within specifications ENGINE COMPRESSION - must be within specifications ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks. ENGINE PCV SYSTEM - must flow freely TORQUE CONVERTER STALL SPEED - must be within specifications POWER BRAKE BOOSTER - no internal vacuum leaks FUEL - must be free of contamination FUEL INJECTOR - plugged or restricted injector; control wire not connected to correct injector Are there any engine mechanical problems?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Test Complete.</p>	All
13	<p>Turn the ignition on. Disconnect the O2 Sensor harness connector. With the DRBIII®, monitor the O2 Sensor voltage. Is the O2 Sensor voltage between 0.40 to 0.60 volt?</p> <p>Yes → Replace the O2 Sensor Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 14</p>	All

P0171-1/1 FUEL SYSTEM LEAN — Continued

TEST	ACTION	APPLICABILITY
14	<p>Turn the ignition off. Disconnect the O2 Sensor harness connector. Disconnect the PCM harness connector. Measure the resistance of the O2 Sensor Signal circuit in the PCM harness connector to ground. Is the voltage above 5.0 ohms?</p> <p>Yes → Repair the O2 Sensor Signal for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 15</p>	All
15	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace and program the Powertrain Control Module Module in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
16	<p>NOTE: Check for contaminates that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant. WARNING: KEEP CLEAR OF THE ENGINE'S MOVING PARTS. NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition. With the engine running at normal operating temperature, monitor the DRBIII® parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set. Allow the O2 Sensor voltage to stabilize between 0.4 to 0.6 volts.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, actuate the O2 Heater Test.</p> <p>With the DRBIII®, monitor O2 Sensor voltage for at least 2 minutes.</p> <p>Does the voltage stay between 0.4 and 0.6 volt?</p> <p>Yes → Replace the O2 Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 8</p>	All
8	<p>NOTE: The engine must be at operating temperature and in closed loop to perform this test.</p> <p>Start the engine.</p> <p>Allow the engine to reach normal operating temperature.</p> <p>With the DRBIII® select System Tests, perform the Purge Vapors Test.</p> <p>Observe the Short Term Adaptive value and press 3 to flow.</p> <p>NOTE: Short Term Adaptive value change.</p> <p>Did the Short Term Adaptive value change?</p> <p>Yes → Go To 9</p> <p>No → Refer to the Driveability category and perform the appropriate symptomm. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All

P0172-1/1 FUEL SYSTEM RICH — Continued

TEST	ACTION	APPLICABILITY
9	<p>Turn the ignition on. With the DRBIII®, read TP Sensor voltage. NOTE: The throttle must be against the stop. Is the voltage 0.92 or less with the Throttle closed?</p> <p>Yes → Go To 10</p> <p>No → Check for a binding throttle condition. If OK, replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
10	<p>Turn the ignition on. With the DRBIII®, read the TP Sensor voltage. While monitoring the DRBIII®, slowly open and close the throttle. Does the voltage increase and decrease smoothly?</p> <p>Yes → Go To 11</p> <p>No → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
11	<p>Turn the ignition off. Connect a Vacuum Gauge to a Manifold Vacuum source. Start the engine. Allow the engine to idle. Note: If engine will not idle, maintain a constant RPM above idle. With the DRBIII® in Sensors, read the MAP Sensor vacuum value. Is the DRB reading within 1" of the Vacuum Gauge reading?</p> <p>Yes → Go To 12</p> <p>No → Replace the MAP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
12	<p>Note: For this test to be valid, the thermostat must be operating correctly. Note: This test works best if performed on a cold engine (cold soak) Turn the ignition on. With the DRBIII®, read the Engine Coolant Temperature Sensor value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature. Note: If engine coolant temperature is above 82°C (180°F), allow the engine to cool until 65°C (150°F) is reached. Start the Engine. During engine warm-up, monitor the Engine Coolant Temperature value. The temp value change should be a smooth transition from start up to normal operating temp 82°C (180°F). The value should reach at least 82°C (180°F). Did the Engine Coolant Temperature increase smoothly and did it reach at least 82°C (180°F)?</p> <p>Yes → Go To 13</p> <p>No → Replace the Engine Coolant Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All

Symptom List:

P0201-INJECTOR #1 CONTROL CIRCUIT
P0202-INJECTOR #2 CONTROL CIRCUIT
P0203-INJECTOR #3 CONTROL CIRCUIT
P0204-INJECTOR #4 CONTROL CIRCUIT
P0205-INJECTOR #5 CONTROL CIRCUIT
P0206-INJECTOR #6 CONTROL CIRCUIT

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be P0201-INJECTOR #1 CONTROL CIRCUIT.

When Monitored and Set Condition:

P0201-INJECTOR #1 CONTROL CIRCUIT

When Monitored: With battery voltage greater than 10.4 volts, the auto shutdown relay energized, injector pulse width less than 10ms, and engine speed less than 3000 rpm.

Set Condition: This trouble code takes .64 to 10.0 seconds to set when no inductive kick is sensed .18ms after injector turn off, and with no other injectors on.

P0202-INJECTOR #2 CONTROL CIRCUIT

When Monitored: With battery voltage greater than 10.4 volts, the auto shutdown relay energized, injector pulse width less than 10ms, and engine speed less than 3000 rpm.

Set Condition: This trouble code takes .64 to 10.0 seconds to set when no inductive kick is sensed .18ms after injector turn off, and with no other injectors on.

P0203-INJECTOR #3 CONTROL CIRCUIT

When Monitored: With battery voltage greater than 10.4 volts, the auto shutdown relay energized, injector pulse width less than 10ms, and engine speed less than 3000 rpm.

Set Condition: This trouble code takes .64 to 10.0 seconds to set when no inductive kick is sensed .18ms after injector turn off, and with no other injectors on.

P0204-INJECTOR #4 CONTROL CIRCUIT

When Monitored: With battery voltage greater than 10.4 volts, the auto shutdown relay energized, injector pulse width less than 10ms, and engine speed less than 3000 rpm.

Set Condition: This trouble code takes .64 to 10.0 seconds to set when no inductive kick is sensed .18ms after injector turn off, and with no other injectors on.

P0205-INJECTOR #5 CONTROL CIRCUIT

When Monitored: With battery voltage greater than 10.4 volts, the auto shutdown relay energized, injector pulse width less than 10ms, and engine speed less than 3000 rpm.

Set Condition: This trouble code takes .64 to 10.0 seconds to set when no inductive kick is sensed .18ms after injector turn off, and with no other injectors on.

P0201-INJECTOR #1 CONTROL CIRCUIT — Continued**P0206-INJECTOR #6 CONTROL CIRCUIT**

When Monitored: With battery voltage greater than 10.4 volts, the auto shutdown relay energized, injector pulse width less than 10ms, and engine speed less than 3000 rpm.

Set Condition: This trouble code takes .64 to 10.0 seconds to set when no inductive kick is sensed .18ms after injector turn off, and with no other injectors on.

POSSIBLE CAUSES

WIRING HARNESS INSPECTION

ASD RELAY OUTPUT CIRCUIT

FUEL INJECTOR

FUEL INJECTOR DRIVER CIRCUIT OPEN

FUEL INJECTOR DRIVER CIRCUIT SHORTED TO GROUND

POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTCs. Is the Good Trip Counter displayed and equal to 0 for the DTC? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Disconnect the Fuel Injector harness connector. Turn the ignition on. With the DRBIII®, actuate the ASD Relay. Using a 12 volt test light connected to ground, probe the ASD Relay output circuit in the Fuel Injector harness connector. Does the test light illuminate brightly? Yes → Go To 3 No → Repair the ASD Relay output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
3	Turn the ignition off. Disconnect the Fuel Injector harness connector. Using a 12 volt test light connected to battery voltage, probe the Fuel Injector driver circuit. With the DRBIII®, actuate the Fuel Injector. Does the test light blink/flicker? Yes → Replace the Fuel Injector. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All

P0201-INJECTOR #1 CONTROL CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the Fuel Injector harness connector. Disconnect the PCM harness connector. Measure the resistance of the Fuel Injector driver circuit between the Fuel Injector harness connector and the PCM harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 5</p> <p>No → Repair the Fuel Injector driver circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
5	<p>Turn the ignition off. Disconnect the Fuel Injector harness connector. Disconnect the PCM harness connector. Measure the resistance between ground and the Fuel Injector driver circuit in the Fuel Injector harness connector. Is the resistance below 100k ohms?</p> <p>Yes → Repair the Fuel Injector driver circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 6</p>	All
6	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Powertrain Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
7	<p>At this time, the conditions required to set the DTC are not present. NOTE: Use the Freeze Frame Data to help duplicate the conditions that set the DTC. Pay particular attention to the DTC set conditions, such as: VSS, MAP, ECT and Load. Note: Visually inspect the related wiring harness, look for any chafed, pierced, pinched, or partially broken wires. Note: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Note: Refer to any technical service bulletins that may apply. Perform a wiggle test of the wiring harness and connectors while the engine is running. Listen for the engine to miss or stall. Also, watch for the Good Trip Counter to change to zero. Were any problems found?</p> <p>Yes → Repair the wiring harness/connector as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Test Complete.</p>	All

Symptom List:**P0300-MULTIPLE CYLINDER MIS-FIRE****P0301-CYLINDER #1 MISFIRE****P0302-CYLINDER #2 MISFIRE****P0303-CYLINDER #3 MISFIRE****P0304-CYLINDER #4 MISFIRE****P0305-CYLINDER #5 MISFIRE****P0306-CYLINDER #6 MISFIRE**

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be P0300-MULTIPLE CYLINDER MIS-FIRE.

When Monitored and Set Condition:**P0300-MULTIPLE CYLINDER MIS-FIRE**

When Monitored: Any time the engine is running, and the adaptive numerator has been successfully updated.

Set Condition: When more than a 2% (1.5% LEV) misfire rate is measured during two trips (one trip California), or with a 10% to 30% misfire rate during one trip.

P0301-CYLINDER #1 MISFIRE

When Monitored: Any time the engine is running, and the adaptive numerator has been successfully updated.

Set Condition: When more than a 2% (1.5% LEV) misfire rate is measured during two trips (one trip California), or with a 10% to 30% misfire rate during one trip.

P0302-CYLINDER #2 MISFIRE

When Monitored: Any time the engine is running, and the adaptive numerator has been successfully updated.

Set Condition: When more than a 2% (1.5% LEV) misfire rate is measured during two trips (one trip California), or with a 10% to 30% misfire rate during one trip..

P0303-CYLINDER #3 MISFIRE

When Monitored: Any time the engine is running, and the adaptive numerator has been successfully updated.

Set Condition: When more than a 2% (1.5% LEV) misfire rate is measured during two trips (one trip California), or with a 10% to 30% misfire rate during one trip.

P0304-CYLINDER #4 MISFIRE

When Monitored: Any time the engine is running, and the adaptive numerator has been successfully updated.

Set Condition: When more than a 2% (1.5% LEV) misfire rate is measured during two trips (one trip California), or with a 10% to 30% misfire rate during one trip.

P0300-MULTIPLE CYLINDER MIS-FIRE — Continued

P0305-CYLINDER #5 MISFIRE

When Monitored: Any time the engine is running, and the adaptive numerator has been successfully updated.

Set Condition: When more than a 2% (1.5% LEV) misfire rate is measured during two trips (one trip California), or with a 10% to 30% misfire rate during one trip..

P0306-CYLINDER #6 MISFIRE

When Monitored: Any time the engine is running, and the adaptive numerator has been successfully updated.

Set Condition: When more than a 2% (1.5% LEV) misfire rate is measured during two trips (one trip California), or with a 10% to 30% misfire rate during one trip.

POSSIBLE CAUSES

ENGINE MECHANICAL PROBLEM
 ERRATIC CAM/CRANK SENSOR SIGNALS
 FUEL SYSTEM PROBLEM
 MIS-FIRE CONDITIONS NO LONGER EXIST
 OTHER POSSIBLE CAUSES FOR MIS-FIRE
 SECONDARY IGNITION OR MECHANICAL PROBLEM

TEST	ACTION	APPLICABILITY
1	<p>Note: Repair all other PCM DTC's before continuing with this test. With the DRBIII®, read DTC's. Is the MIS-FIRE GOOD TRIP counter displayed and equal to zero?</p> <p>Yes → Go To 2 No → Go To 4</p>	All
2	<p>At this time the conditions that set the Misfire DTC are present. With the DRBIII®, select DTC's and RELATED FUNCTIONS. Read and record the FREEZE FRAME DATA. Select OBD II MONITORS. Read and record the MIS-FIRE SIMILAR CONDITIONS WINDOW DATA. With these screens, attempt to duplicate the condition(s) that has set this DTC. When the vehicle is operating in the SIMILAR CONDITIONS WINDOW, refer to the WHICH CYLINDER IS MISFIRING screen. Observe the WHICH CYLINDER IS MISFIRING screen for at least one minute. Is the DRBIII® counting mis-fires at this time?</p> <p>Yes → Go To 3 No → Test Complete.</p>	All

P0300-MULTIPLE CYLINDER MIS-FIRE — Continued

TEST	ACTION	APPLICABILITY
3	<p>With the DRBIII®, read the FREEZE FRAME DATA. Use the FREEZE FRAME DATA and attempt to determine the cause of the Misfire DTC. In the FREEZE FRAME, are the adaptive fuel percentages greater than +/- 15%?</p> <p>Yes → Refer to the Driveability Category and perform the Checking Fuel Delivery symptom. Perform FUEL SYSTEM/MISFIRE MONITOR VERIFICATION TEST.</p> <p>No → Go To 7</p>	All
4	<p>At this time the mis-fire does not exist or is an intermittent problem. Note: An intermittent problem may have been caused by moisture in the secondary ignition. With the DRBIII®, select DTC's AND RELATED FUNCTIONS. Read and record the FREEZE FRAME DATA. Select OBD II MONITORS. Read and record MIS-FIRE SIMILAR CONDITIONS WINDOW DATA. With these screens, attempt to duplicate the condition that has set the Misfire DTC. While using FREEZE FRAME DATA, pay particular attention to the DTC setting conditions, such as speed, temp, load, and map vacuum. Does the mis-fire recur?</p> <p>Yes → Go To 5</p> <p>No → Test Complete.</p>	All
5	<p>With the DRBIII®, read the FREEZE FRAME DATA. Use the FREEZE FRAME DATA and attempt to determine the cause of the Misfire DTC. In the FREEZE FRAME, are the adaptive fuel percentages greater than +/- 15%?</p> <p>Yes → Refer to the Driveability Category and perform the Checking Fuel Delivery symptom. Perform FUEL SYSTEM/MISFIRE MONITOR VERIFICATION TEST.</p> <p>No → Go To 6</p>	All
6	<p>With the DRBIII®, read the FREEZE FRAME DATA. Use the FREEZE FRAME DATA and attempt to determine the cause of the Misfire DTC. In the FREEZE FRAME DATA, is the engine RPM over 3000 and the operating temp normal?</p> <p>Yes → Test CMP and CKP signals with Lab Scope, check valve timing, and perform running vacuum test. Perform FUEL SYSTEM/MISFIRE MONITOR VERIFICATION TEST.</p> <p>No → Go To 7</p>	All

P0300-MULTIPLE CYLINDER MIS-FIRE — Continued

TEST	ACTION	APPLICABILITY
7	<p>Check for any of the following conditions/mechanical problems.</p> <p>ENGINE VACUUM - must be at least 13 inches in neutral</p> <p>ENGINE VALVE TIMING - must be within specifications</p> <p>ENGINE COMPRESSION - must be within specifications</p> <p>ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks.</p> <p>ENGINE PCV SYSTEM - must flow freely</p> <p>TORQUE CONVERTER STALL SPEED - must be within specifications</p> <p>POWER BRAKE BOOSTER - no internal vacuum leaks</p> <p>FUEL - must be free of contamination</p> <p>FUEL INJECTOR - plugged or restricted injector; control wire not connected to correct injector</p> <p>Are there any engine mechanical problems?</p> <p>Yes → Repair as necessary. Perform FUEL SYSTEM/MISFIRE MONITOR VERIFICATION TEST.</p> <p>No → Go To 8</p>	All
8	<p>With the DRBIII®, read the FREEZE FRAME DATA.</p> <p>Use the FREEZE FRAME DATA and attempt to determine the cause of the Misfire DTC.</p> <p>In the FREEZE FRAME DATA, is the LOAD VALUE over 50% and the operating temp normal?</p> <p>Yes → Check secondary ignition, compression, and cylinder leakage. Perform FUEL SYSTEM/MISFIRE MONITOR VERIFICATION TEST.</p> <p>No → Go To 9</p>	All
9	<p>Note: Anything that affects the speed of the crankshaft can cause a misfire DTC.</p> <p>The following are other possible causes for mis-fire:</p> <p>Injector harness connectors, secondary ignition problem, mechanical engine problem, PCM power grounds, irregular cam and crank signal, plugged injectors, restricted exhaust, intake restriction, damaged trigger wheel, contaminated fuel, or vacuum leak.</p> <p>Weak valve springs, carbon deposits on valves, or accessory drive belt (serpentine belt).</p> <p>Check for any TSB's that may relate to a Misfire DTC.</p> <p>Do any of the above causes exist?</p> <p>Yes → Repair as necessary. Perform FUEL SYSTEM/MISFIRE MONITOR VERIFICATION TEST.</p> <p>No → Test Complete.</p>	All

Symptom:**P0320-NO CRANK REFERENCE SIGNAL AT PCM****When Monitored and Set Condition:****P0320-NO CRANK REFERENCE SIGNAL AT PCM**

When Monitored: With the ignition on.

Set Condition: No signal from the crankshaft position sensor is present during engine cranking, and at least 3 camshaft position sensor signals have occurred.

POSSIBLE CAUSES

Symptom:**P0351-IGNITION COIL # 1 PRIMARY CIRCUIT****When Monitored and Set Condition:****P0351-IGNITION COIL # 1 PRIMARY CIRCUIT**

When Monitored: With battery voltage greater than 8 volts during engine cranking or greater than 12 volts with engine running, engine rpm less than 2016, and none of the coils in dwell when checked.

Set Condition: Peak current is not achieved with battery based dwell plus 1.5 msec of diagnostic offset. It takes less than 3 seconds during cranking or up to 6 seconds while running to set.

POSSIBLE CAUSES

OPEN/HIGH RESISTANCE IN THE ASD RELAY OUTPUT CIRCUIT

IGNITION COIL NO. 1 DRIVER CIRCUIT OPEN

COIL RAIL

IGNITION COIL NO. 1 DRIVER CIRCUIT SHORTED TO GROUND

WIRING HARNESS INTERMITTENT

POWERTRAIN CONTROL MODULE (IGNITION COIL NO. 1 DRIVER)

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTCs. Is the Good Trip Counter displayed and equal to zero for P0351? Yes → Go To 2 No → Go To 8	4.0L MPI I-6
2	Turn the ignition off. Disconnect the coil rail harness connector. Note: The following resistance measurement should be taken at 70-80 degrees F. Measure the primary resistance of the coil rail. Is the resistance between 0.6 and 0.9 ohms? Yes → Go To 3 No → Replace the coil rail. Perform POWERTRAIN VERIFICATION TEST VER - 5.	4.0L MPI I-6

P0351-IGNITION COIL # 1 PRIMARY CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the coil rail harness connector. Turn the ignition on. With the DRBIII®, actuate the generator field. Using a 12-volt test light connected to ground, check the ASD relay output circuit at the coil rail harness connector. Does the test light illuminate brightly?</p> <p>Yes → Go To 4</p> <p>No → Repair the open/high resistance in the ASD relay output circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>Stop All Actuations</p>	4.0L MPI I-6
4	<p>Turn the ignition off. Disconnect the coil rail harness connector. Connect one end of a 12 volt test light to a good 12 volt source (B+). Warning: Keep clear of the engine's moving/rotating parts. Check the ignition coil no. 1 driver circuit, with the other end of the test light, while cranking the engine. Does the test light blink/flicker?</p> <p>Yes → Test Complete.</p> <p>No → Go To 5</p>	4.0L MPI I-6
5	<p>Turn the ignition off. Disconnect the coil rail harness connector. Disconnect the PCM harness connector(s). Measure the resistance of the ignition coil no. 1 driver circuit from the ignition coil connector to the PCM connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 6</p> <p>No → Repair the open ignition coil no. 1 driver circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	4.0L MPI I-6
6	<p>Turn the ignition off. Disconnect the coil rail harness connector. Disconnect the PCM harness connector(s). Measure the resistance between the ignition coil no. 1 driver circuit and ground (B-). Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the ignition coil no. 1 driver circuit shorted to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 7</p>	4.0L MPI I-6

Symptom:

P0420-1/1 CATALYTIC CONVERTER EFFICIENCY

When Monitored and Set Condition:

P0420-1/1 CATALYTIC CONVERTER EFFICIENCY

When Monitored: After engine warm up to 147 deg. F, 180 seconds of open throttle operation, at a speed greater than 20 mph, with the engine at 1200-1700 rpm and MAP vacuum between 15.0 and 21.0 inches of mercury (Hg).

Set Condition: As catalyst efficiency deteriorates, the switch rate of the downstream O2 sensor approaches that of the upstream O2 sensor. If at any point during the test the switch ratio reaches a predetermined value a counter is incremented by one.

POSSIBLE CAUSES

EXHAUST LEAK

CATALYST EFFICIENCY DTC DOES NOT RECUR

ENGINE MECHANICAL PROBLEM

CATALYTIC CONVERTER 1/1

UPSTREAM O2 SENSOR OLDER THAN DOWNSTREAM O2 SENSOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTCs. Is the Good Trip counter displayed and equal to zero? Yes → Go To 3 No → Go To 2	All
2	At this time the Catalyst Efficiency Failure does not exist or is an intermittent problem. With the DRBIII®, read the FREEZE FRAME data. With this screen, attempt to duplicate the condition that has set this fault. While using FREEZE FRAME pay particular attention to the fault setting conditions, such as speed, temp, load, and map vacuum. Does the Catalyst Efficiency Failure Recur? Yes → Go To 3 No → Test Complete.	All
3	Start Engine and let idle. Check for exhaust leaks between the engine and the appropriate downstream O2 Sensor. Is there any exhaust leaks? Yes → Repair or replace leaking exhaust parts as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All

P0420-1/1 CATALYTIC CONVERTER EFFICIENCY — Continued

TEST	ACTION	APPLICABILITY
4	<p>Check the exhaust for excessive smoke from internal oil or coolant leaks. Is there an oil or coolant consumption condition present?</p> <p>Yes → Repair engine mechanical condition as necessary and replace Catalytic Converter. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 5</p>	All
5	<p>NOTE: A new Downstream O2 Sensor along with an aging Upstream O2 Sensor may cause this trouble code to set. Review vehicle repair history. Has the Downstream O2 Sensor been replaced without replacing the Upstream O2 Sensor?</p> <p>Yes → Replace the appropriate Upstream Oxygen Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 6</p>	All
6	<p>If there are no possible causes remaining, view repair.</p> <p>Repair Replace the Catalytic Converter. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All

Symptom:

P0441-EVAP PURGE FLOW MONITOR

When Monitored and Set Condition:

P0441-EVAP PURGE FLOW MONITOR

When Monitored: With engine temperature greater than 170 deg. F, fuel control in closed loop, engine idling for 2 minutes, no low fuel, MAP less than 15.7 inches mercury and barometric altitude less than 8,000 feet.

Set Condition: After having passed the Leak Detection Pump (LDP) test, no air flow through the evaporative system is detected by the evap monitor.

POSSIBLE CAUSES

EVAP CANISTER
 WIRING HARNESS INTERMITTENT
 EVAP PURGE HOSE (CANISTER TO FUEL TANK)
 EVAP PURGE HOSE (SOLENOID TO CANISTER)
 EVAP PURGE SOLENOID VACUUM SUPPLY
 EVAP PURGE SOLENOID (LEAKY/STUCK OPEN)
 EVAP PURGE SOLENOID (STUCK CLOSED)

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip Counter displayed and equal to zero for P-0441? Yes → Go To 2 No → Go To 8	All
2	Visually inspect the Evap canister. Look for any physical damage or any signs of fuel that has entered the canister. Any signs of fuel may indicate a bad rollover valve. Were any problems found? Yes → Repair or Replace as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All
3	Visually inspect the Evap purge hose that goes between the Evap canister and the fuel tank. Look for any physical damage such as a pinched, plugged, ripped or dry rotted hose. Were any problems found? Yes → Repair or replace hose as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4	All

P0441-EVAP PURGE FLOW MONITOR — Continued

TEST	ACTION	APPLICABILITY
4	<p>Visually inspect the Evap purge hose that goes from the Purge Solenoid to the Evap Canister. Look for any physical damage such as a pinched, plugged, ripped or dry rotted hose.</p> <p>Were any problems found?</p> <p>Yes → Repair or replace hose as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off.</p> <p>Carefully inspect the Evap Purge Solenoid vacuum supply hose for proper routing. Also check for a pinched or plugged hose from the throttle body to the Purge Solenoid. Inspect the vacuum nipple at the throttle body for any damage or plugging.</p> <p>Is the vacuum supply hose and throttle body vacuum nipple free from defects?</p> <p>Yes → Go To 6</p> <p>No → Repair the vacuum supply hose/tube as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
6	<p>Note: After disconnecting the Evap Purge Solenoid vacuum connections, inspect the lines and solenoid for any signs of contamination from the EVAP Canister. This may indicate a faulty rollover valve. Replace purge solenoid if contamination is found</p> <p>Turn the ignition off.</p> <p>Disconnect the vacuum hoses at the EVAP Purge Solenoid.</p> <p>Using a hand vacuum pump, apply 10 inches of vacuum to the Evap Purge Solenoid vacuum source port. (component side)</p> <p>Does the Evap Purge Solenoid hold vacuum?</p> <p>Yes → Go To 7</p> <p>No → Replace the Evap Purge Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
7	<p>Using a hand vacuum pump, apply 10 inches of vacuum to the Evap Purge Solenoid vacuum source port. (component side)</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, actuate the "EVAP Purge Solenoid" and observe the vacuum gauge.</p> <p>Does the vacuum drop when the solenoid is actuated?</p> <p>Yes → Test Complete.</p> <p>No → Replace the Evap Purge Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All

P0441-EVAP PURGE FLOW MONITOR — Continued

TEST	ACTION	APPLICABILITY
8	<p>At this time, the conditions required to set the DTC are not present.</p> <p>Note: Use the Freeze Frame Data to help you duplicate the conditions that set the DTC. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Note: Refer to any technical service bulletins that may apply.</p> <p>Perform a wiggle test of the Evap Purge Solenoid wiring while the circuit is actuated with the DRBIII®. Listen for the solenoid to quit actuating. Also watch for the Good Trip Counter to change to 0.</p> <p>Were any problems found?</p> <p>Yes → Repair wiring harness/connectors as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Test Complete.</p>	All

Symptom List:**P0442-EVAP LEAK MONITOR MEDIUM (0.040) LEAK DETECTED****P0455-EVAP LEAK MONITOR LARGE LEAK DETECTED****P0456-EVAP LEAK MONITOR SMALL LEAK DETECTED (.020)**

Test Note: All symptoms listed above are diagnosed using the same tests.
 The title for the tests will be **P0442-EVAP LEAK MONITOR MEDIUM (0.040) LEAK DETECTED.**

When Monitored and Set Condition:**P0442-EVAP LEAK MONITOR MEDIUM (0.040) LEAK DETECTED**

When Monitored: Immediately after a cold start, with battery/ambient temperature between 40 deg. F and 90 deg. F and coolant temperature within 10 deg. F of battery/ambient.

Set Condition: If there is a leak larger than 0.040" and smaller than 0.080" in the evaporative system.

P0455-EVAP LEAK MONITOR LARGE LEAK DETECTED

When Monitored: Immediately after a cold start, with battery/ambient temperature between 40 deg. F and 90 deg. F and coolant temperature within 10 deg. F of battery/ambient.

Set Condition: There is a leak larger than 0.080" in the evaporative system.

P0456-EVAP LEAK MONITOR SMALL LEAK DETECTED (.020)

When Monitored: Immediately after a cold start, with battery/ambient temperature between 40 deg. F and 90 deg. F and coolant temperature within 10 deg. F of battery/ambient.

Set Condition: There is a leak larger than 0.080" in the evaporative system.

POSSIBLE CAUSES

CONFIRMED LEAK IN THE EVAP SYSTEM

INTERMITTENT LDP MONITOR FAILURE

TEST	ACTION	APPLICABILITY
1	<p>Note: A loose gas cap could have caused this DTC to set. Make sure gas cap is tight and in good condition. Ensure the gas cap meets OEM specifications.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, read DTC's.</p> <p>Is the DTC Specific Good Trip Counter displayed and equal to zero?</p> <p>Yes → Go To 2</p> <p>No → Go To 4</p>	All

P0442-EVAP LEAK MONITOR MEDIUM (0.040) LEAK DETECTED — Continued

TEST	ACTION	APPLICABILITY
2	<p>To continue testing you will need Miller Tools #6872A (Evap System Pressure Pump) and #8382 (Gas Cap Tester/Adapter).</p> <p>Warning: The test equipment is designed to be used to pressurize the vehicles Evaporative System only. Using the equipment in a manner for which it was not designed could be harmful.</p> <p>Warning: Keep lighted cigarettes, sparks, flames, and other ignition sources away from the test area to prevent the ignition of explosive gases. Keep the test area well ventilated.</p> <p>Note: The fuel tank should have between 20% and 80% of fuel tank capacity to properly test the Evap system.</p> <p>Attach the power source clip (red) of Miller Tool #6872A to Battery (+) and the ground clip (black) to Battery (-).</p> <p>Perform the Evaporative System Pressure Pump self test that is specified on the tester cover.</p> <p>Remove gas cap and install Miller Tool #8382 on vehicle. Install gas cap to Miller Tool #8382. Attach the pressure supply hose from Miller Tool #6872A to the fitting on #8382.</p> <p>Disconnect the vacuum supply hose at the Leak Detection Pump. Connect and apply a continuous vacuum supply (i.e. 20"Hg) to the Leak Detection Pump. A vacuum pump such as an A/C recovery unit works well.</p> <p>Ignition on, engine not running.</p> <p>With the DRBIII® in System Tests, select "Leak Detect Pump Test." Read instructions and then press Enter. Select: #3 - HOLD PSI.</p> <p>On Miller Tool #6872A, set the Pressure/Hold switch to Open and set the Vent switch to Closed. Turn the pump timer On and watch the gauge.</p> <p>Note: If the pressure does not build up, there is obviously a large leak in the system and the presence of strong fuel odor may be present. A visual inspection should find a leak of substantial size.</p> <p>When the gauge pressure reaches 14"H2O, turn the Pressure/Hold Valve to Closed. Turn the pump timer off. Note the time and pressure. After 10 sec of stabilization time.</p> <p>Did the pressure drop more than 6"H2O in 2 minutes?</p> <p>Yes → Go To 3</p> <p>No → Go To 4</p>	All
3	<p>Note: A thorough visual inspection of the Evap system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may aid diagnosis also.</p> <p>To continue testing, you will need Miller Tool #6904A (Ultrasonic Leak Detector.)</p> <p>NOTE: The LDP System Test should still be running. If the DRBIII® read has timed out, restart the System Test.</p> <p>Using Miller Tool #6872A, set the Pressure/Hold Switch to Open, and the Vent Switch to Closed. Turn the pump timer on to pressurize/re-pressurize the Evap System.</p> <p>Using the Ultrasonic Leak Detector, start listening for leaks in the Evap System. Carefully leak test all hoses, tubes, and connections.</p> <p>Were any leaks heard with the Ultrasonic Leak Detector?</p> <p>Continue</p> <p>Repair or replace the leaking component as necessary.</p> <p>Perform POWERTRAIN VERIFICATION TEST VER - 6.</p>	All

P0442-EVAP LEAK MONITOR MEDIUM (0.040) LEAK DETECTED — Continued

TEST	ACTION	APPLICABILITY
4	<p>At this time, the conditions required to set the DTC are not present.</p> <p>Note: Use the Freeze Frame Data to help you duplicate the conditions that set the DTC. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.</p> <p>Note: A thorough visual inspection of the Evap system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may aid diagnosis also.</p> <p>Note: Refer to any Technical Service Bulletins (TSB's) that may apply.</p> <p>With the DRBIII® in System Tests, perform the LDP Monitor Test. This will force the PCM to run the LDP Monitor. If the monitor fails, further diagnosis is required to find faulty component. If the monitor passes, the condition is not present at this time. Were any problems found?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 6.</p> <p>No → Test Complete.</p>	All

Symptom:

P0443-EVAP PURGE SOLENOID CIRCUIT

When Monitored and Set Condition:

P0443-EVAP PURGE SOLENOID CIRCUIT

When Monitored: At ignition key on and battery voltage greater than 10.4 volts, during initialization or power-up.

Set Condition: Not powering down, not in limp-in and time since last solenoid activation is greater than 72 micro seconds. The PCM will set a trouble code if the actual state of the solenoid does not match the intended state on two consecutive key cycles.

POSSIBLE CAUSES

FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
 EVAP PURGE SOLENOID CONTROL CIRCUIT OPEN
 EVAP PURGE SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
 WIRING HARNESS INTERMITTENT
 EVAP PURGE SOLENOID
 POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the DTC Specific Good Trip Counter displayed and equal to zero for P0443? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Disconnect the Evap Purge Solenoid connector. Measure the resistance between the terminals of the Evap Purge Solenoid. Is the resistance between 30.0 and 40.0 ohms? Yes → Go To 3 No → Replace the Evap Purge Solenoid. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
3	Turn the ignition off. Disconnect the Evap Purge Solenoid harness connector. Note: Check connectors - Clean/repair as necessary. Turn the ignition on. Measure the Fused Ignition Switch Output Circuit at the Evap Purge Solenoid harness connector. Is the voltage above 10.0 volts? Yes → Go To 4 No → Repair the open Fused Ignition Switch Output Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P0443-EVAP PURGE SOLENOID CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the Evap Purge Solenoid harness connector. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance of the Evap Purge Solenoid Control Circuit from the Powertrain Control Module connector to the Evap Purge Solenoid connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 5</p> <p>No → Repair the open Evap Purge Solenoid Control Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
5	<p>Turn the ignition off. Disconnect the Evap Purge Solenoid harness connector. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance between the Evap Purge Solenoid Control Circuit and ground (B-). Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the short to ground in the Evap Purge Solenoid Control Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 6</p>	All
6	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Powertrain Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
7	<p>At this time, the conditions required to set the DTC are not present. Note: Use the Freeze Frame Data to help you duplicate the conditions that set the DTC. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load. Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Note: Refer to any technical service bulletins that may apply. Perform a wiggle test of the Evap Purge Solenoid wiring while the circuit is actuated with the DRBIII®. Listen for the solenoid to quit actuating. Also watch for the Good Trip Counter to change to 0. Were any problems found?</p> <p>Yes → Repair wiring harness/connectors as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Test Complete.</p>	All

Symptom List:

P0460-FUEL LEVEL UNIT NO CHANGE OVER MILES

P0461-FUEL LEVEL UNIT NO CHANGE OVER TIME

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be **P0460-FUEL LEVEL UNIT NO CHANGE OVER MILES**.

When Monitored and Set Condition:

P0460-FUEL LEVEL UNIT NO CHANGE OVER MILES

When Monitored: Engine running and fuel level either below 15% or above 85% of capacity.

Set Condition: The PCM sees low fuel, less than 15%, for more than 120 miles or fuel level does not change by at least 4% for more than 250 miles.

P0461-FUEL LEVEL UNIT NO CHANGE OVER TIME

When Monitored: Engine running and fuel level either below 15% or above 85% of capacity.

Set Condition: The PCM sees low fuel, less than 15%, for more than 120 miles or fuel level does not change by at least 4% for more than 250 miles.

POSSIBLE CAUSES

PHYSICALLY DAMAGED/DEFORMED/OBSTRUCTED FUEL TANK

FUEL LEVEL SENSOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Warning: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Remove the fuel tank. Remove the fuel pump module from the fuel tank. Inspect the inside of the fuel tank for any obstructions or deformities. Is the fuel tank free from defects? Yes → Go To 2 No → Repair or replace the fuel tank as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
2	If there are no possible causes remaining, view repair. Repair Replace the fuel level sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

Symptom:**P0462-FUEL LEVEL SENDING UNIT VOLTS TOO LOW****When Monitored and Set Condition:****P0462-FUEL LEVEL SENDING UNIT VOLTS TOO LOW**

When Monitored: Ignition on and battery voltage above 10.4 volts.

Set Condition: The fuel level sensor signal voltage goes below 0.2 volts at the PCM for more than 5 seconds.

POSSIBLE CAUSES

FUEL PUMP MODULE WIRING HARNESS INTERMITTENT

FUEL LEVEL SENSOR

FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

POWERTRAIN CONTROL MODULE

FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO SENSOR GROUND CIRCUIT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read the fuel level sensor voltage. Is the fuel level sensor voltage below 0.4 volts? Yes → Go To 2 No → Go To 3	All
2	Turn the ignition off. Disconnect the Fuel Pump Module electrical connector. Turn the ignition on. With the DRBIII®, read the Fuel Level Sensor voltage. Did the Fuel Level Sensor voltage change from below 0.4 volts to above 9.0 volts? Yes → Replace the fuel level sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 5	All
3	Turn the ignition off. Disconnect the Fuel Pump Module electrical connector. Turn the ignition on. With the DRBIII®, read the Fuel Level Sensor voltage. Did the Fuel Level Sensor voltage change from below 0.4 volts to above 9.0 volts? Yes → Replace the fuel level sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 4	All

P0462-FUEL LEVEL SENDING UNIT VOLTS TOO LOW — Continued

TEST	ACTION	APPLICABILITY
4	<p>Note: Visually inspect the wiring harness leading to the fuel pump module. Look for any parts of the wiring harness that may be pinched or rubbed through.</p> <p>Turn the ignition on. With the DRBIII®, monitor the fuel level sensor voltage. Using the schematic, wiggle the Fuel Pump Module Connector & Harness. Was there any fuel level sensor voltage change, during the wiggle test?</p> <p>Yes → Repair the wiring harness as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the Fuel Pump Module harness connector. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance between the Fuel Level Sensor Signal Circuit and ground (B-). Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the fuel level sensor signal circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off. Disconnect the Fuel Pump Module harness connector. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance between the Fuel Level Sensor Signal Circuit and the Sensor Ground Circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the fuel level sensor signal circuit shorted to the sensor ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Go To 7</p>	All
7	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Powertrain Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p>	All

Symptom:**P0463-FUEL LEVEL SENDING UNIT VOLTS TOO HIGH****When Monitored and Set Condition:****P0463-FUEL LEVEL SENDING UNIT VOLTS TOO HIGH**

When Monitored: Ignition on and battery voltage above 10.4 volts.

Set Condition: The fuel level sensor signal voltage at the PCM goes above 9.9 volts for more than 90 seconds.

POSSIBLE CAUSES

FUEL LEVEL SENSOR SIGNAL CIRCUIT OPEN

FUEL PUMP MODULE WIRING HARNESS INTERMITTENT

SENSOR GROUND CIRCUIT OPEN

FUEL LEVEL SENSOR

POWERTRAIN CONTROL MODULE

FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO SENSOR GROUND CIRCUIT

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read the fuel level sensor voltage. Is the fuel level sensor voltage above 9.9 volts? Yes → Go To 2 No → Go To 3	All
2	Turn the ignition off. Disconnect the Fuel Pump Module electrical harness connector. Connect a jumper wire between the Fuel Level Sensor signal circuit and the Sensor Ground circuit at the Fuel Pump Module harness connector. Turn the ignition on. With the DRBIII®, read the Fuel Level Sensor voltage. Did the Fuel Level Sensor voltage change from above 9.0 volts to below 0.4 volts? Yes → Replace the fuel level sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 5	All

P0463-FUEL LEVEL SENDING UNIT VOLTS TOO HIGH — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Fuel Pump Module electrical harness connector. Connect a jumper wire between the Fuel Level Sensor signal circuit and the Sensor Ground circuit at the Fuel Pump Module harness connector. Turn the ignition on. TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Disconnect the fuel pump module harness connector. Disconnect the PCM harness connector(s). Note: Check connectors - It is critical that the connector is free from any signs of corrosion or deformities - Clean/repair as necessary. Measure the fuel level sensor signal circuit from the PCM harness connector to the Fuel Pump Module harness connector. Is the resistance below 5.0 ohms? Yes → Go To 8 No → Repair the open fuel level sensor signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
8	If there are no possible causes remaining, view repair. Repair Replace the Powertrain Control Module Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

Symptom:

P0500-NO VEHICLE SPEED SENSOR SIGNAL

When Monitored and Set Condition:

P0500-NO VEHICLE SPEED SENSOR SIGNAL

When Monitored: Engine Temperature greater than 104 deg F , MAP vacuum approximately 15" to 16" inches of mercury and Engine RPM between 1400 and 3000 rpm.

Set Condition: No Vehicle Speed Signal for more than 15 seconds on two consecutive trips.

POSSIBLE CAUSES

INTERMITTENT VEHICLE SPEED SIGNAL

5 VOLT SUPPLY CIRCUIT OPEN

SENSOR GROUND CIRCUIT OPEN

VEHICLE SPEED SIGNAL CIRCUIT OPEN

VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO GROUND

VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO VOLTAGE

POWERTRAIN CONTROL MODULE (VEHICLE SPEED SENSOR)

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII [®] , read PCM DTCs. Is the Good Trip Counter for P-0500 displayed and equal to 0? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Disconnect the PCM harness connector(s). Disconnect the Vehicle Speed Sensor harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance of the 5 Volt Supply circuit. Is the resistance above 5.0 ohms? Yes → Repair the 5 Volt Supply circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All

P0500-NO VEHICLE SPEED SENSOR SIGNAL — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the PCM harness connector(s). Disconnect the Vehicle Speed Sensor harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance of the Vehicle Speed Sensor Ground circuit. Is the resistance above 5.0 ohms?</p> <p>Yes → Repair the Vehicle Speed Sensor Ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 4</p>	All
4	<p>Turn the ignition off. Disconnect the PCM harness connector(s). Disconnect the Vehicle Speed Sensor harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance of the Vehicle Speed Signal circuit between the PCM connector and the VSS connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 21</p> <p>No → Repair the open IAC Driver Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
21	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Powertrain Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
22	<p>Start the engine. With the DRBIII® in Systems Test, perform the IAC Wiggle Test. Note: The idle speed should raise and lower with the display. Wiggle the Wiring Harness from the IAC Motor to the PCM. Observe for the IAC Motor to stop operating. Did the IAC Motor stop operating at any time?</p> <p>Yes → Repair the Harness or Connectors as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 23</p>	All
23	<p>Turn the ignition off. Inspect the IAC Wiring and Connectors from the IAC motor to the PCM. Were any problems found?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Test Complete.</p>	All

Symptom:

P0522-OIL PRESSURE SENSOR VOLTS LOW

When Monitored and Set Condition:

P0522-OIL PRESSURE SENSOR VOLTS LOW

When Monitored: With the ignition key on and battery voltage above 10.4 volts.

Set Condition: The oil pressure sensor voltage at PCM goes below 0.1 volt for 0.5 seconds.

POSSIBLE CAUSES

OIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

WIRING HARNESS INTERMITTENT

OIL PRESSURE 5-VOLT SUPPLY CIRCUIT OPEN

OIL PRESSURE SENSOR (SHORTED)

OIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO SENSOR GROUND CIRUCIT

POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>Ignition on, engine not running. With the DRBIII® in Sensors, read the Oil Pressure Sensor voltage. Is the Oil Pressure Sensor voltage above 0.1 volt?</p> <p>Yes → Go To 2</p> <p>No → Go To 3</p>	All
2	<p>At this time, the conditions required to set the DTC are not present. Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Note: Refer to any technical service bulletins that may apply. Start the engine. With the DRBIII®, monitor the Oil Pressure Sensor voltage. Wiggle the wiring harness and connectors from the Oil Pressure Sensor to the PCM harness connectors. Did the voltage change?</p> <p>Yes → Repair wiring harness/connectors where the voltage changed during the test. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Test Complete.</p>	All

P0522-OIL PRESSURE SENSOR VOLTS LOW — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Oil Pressure Sensor harness connector. Note: Check connectors - Clean/repair as necessary. Turn the ignition on. Measure the Oil Pressure Sensor 5-volt Supply Circuit at the harness connector. Is the voltage above 4.9 volts?</p> <p>Yes → Go To 4</p> <p>No → Repair the open Oil Pressure Sensor 5-Volt Supply Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p>	All
4	<p>Turn the ignition off. Disconnect the Oil Pressure Sensor harness connector. Disconnect the PCM harness connector(s). Measure the resistance between the Oil Pressure Sensor Signal Circuit and ground (B-). Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the Oil Pressure Sensor Signal Circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the Oil Pressure Sensor harness connector. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance between the Oil Pressure Sensor Signal Circuit and the Sensor Ground Circuit at the oil pressure sensor harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the Oil Pressure Sensor Signal Circuit shorted to the Sensor Ground Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off. Disconnect the Oil Pressure Sensor harness connector. Note: Check connectors - Clean/repair as necessary. With the DRBIII® in Sensors, read the Oil Pressure Sensor voltage. Is the Voltage above 4.5 Volts?</p> <p>yes Replace the Oil Pressure Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Replace the PCM in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p>	All

Symptom:

P0523-OIL PRESSURE SENSOR VOLTS HIGH

When Monitored and Set Condition:

P0523-OIL PRESSURE SENSOR VOLTS HIGH

When Monitored: With the ignition on and battery voltage above 10.4 volts.

Set Condition: The oil pressure sensor signal at PCM goes above 4.9 volts.

POSSIBLE CAUSES

OIL PRESSURE SENSOR SIGNAL CIRCUIT OPEN
 WIRING HARNESS INTERMITTENT
 SENSOR GROUND CIRCUIT OPEN
 OIL PRESSURE SENSOR (OPEN)
 OIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
 POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII® in Sensors, read the Oil Pressure Sensor voltage.. Is the Oil Pressure Sensor voltage above 4.8 volts? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Disconnect the Oil Pressure Sensor harness connector. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance of the Sensor Ground Circuit between the Oil Press Sensor and the Powertrain Control Module. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open Sensor Ground Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
3	Turn the ignition off. Disconnect the Oil Pressure Sensor harness connector. Disconnect the PCM harness connector(s). Measure the resistance of the Oil Pressure Sensor Signal Circuit from the PCM harness connector to the Oil Pressure Sensor harness connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Oil Pressure Sensor Signal Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

P0523-OIL PRESSURE SENSOR VOLTS HIGH — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the Oil Pressure Sensor harness connector. Note: Check connectors - Clean/repair as necessary. Turn the ignition on. Using a 12 volt test lamp, test the sensor signal circuit for a short to power. Indicated by a bright test lamp. Is the test lamp illuminated and bright?</p> <p>Yes → Repair the Oil Pressure Sensor Signal Circuit shorted to voltage. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the Oil Pressure Sensor harness connector. Note: Check connectors - Clean/repair as necessary. Install a jumper wire between the Sensor Signal circuit, and Sensor Ground circuit, at the Sensor harness connector. Turn the ignition on. With the DRBIII® in Sensors, read the Oil Pressure Sensor voltage. Is the voltage below 1.0 volt?</p> <p>Yes → Replace the Oil Pressure Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Replace the PCM in accordance with the Service Information. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p>	All
6	<p>At this time, the conditions required to set the DTC are not present. Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Note: Refer to any technical service bulletins that may apply. Start the engine. With the DRBIII® in Sensors, read the Oil Pressure Sensor voltage. Wiggle the wiring harness and connectors from the Oil Pressure Sensor to the PCM harness connectors. Did the voltage change?</p> <p>Yes → Repair wiring harness/connectors where the voltage changed during the test. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Test Complete.</p>	All

Symptom:

P0700-TCM DTC PRESENT

POSSIBLE CAUSES
TCM DTC PRESENT SET IN PCM

Repair Instructions:

TCM DTC PRESENT SET IN PCM

A DTC was registered in the Transmission Control Module. With the DRB, go to the TCM and read codes. Refer to the appropriate symptom (DTC).

Symptom List:**P1195-1/1 O2 SENSOR SLOW DURING CATALYST MONITOR****P1196-2/1 O2 SENSOR SLOW DURING CATALYST MONITOR****P1197-1/2 O2 SENSOR SLOW DURING CATALYST MONITOR**

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be P1195-1/1 O2 SENSOR SLOW DURING CATALYST MONITOR.

When Monitored and Set Condition:**P1195-1/1 O2 SENSOR SLOW DURING CATALYST MONITOR**

When Monitored: With the engine running, coolant greater than 170°F, open throttle, steady to slightly increasing vehicle speed greater than 18 mph but less than 55 mph, with a light load on the engine, for a period no less than 5 minutes.

Set Condition: The oxygen sensor signal voltage is switching from below 0.39 volt to above 0.6 volts and back fewer times than required.

P1196-2/1 O2 SENSOR SLOW DURING CATALYST MONITOR

When Monitored: With the engine running, coolant greater than 170°F, open throttle, steady to slightly increasing vehicle speed greater than 18 mph but less than 55 mph, with a light load on the engine, for a period no less than 5 minutes.

Set Condition: The oxygen sensor signal voltage is switching from below 0.39 volt to above 0.6 volts and back fewer times than required.

POSSIBLE CAUSES

O2S SENSOR GROUND CIRCUIT VOLTAGE DROP

O2S SIGNAL CIRCUIT VOLTAGE DROP

EXHAUST LEAK

EXCESSIVE ENGINE BLOW BY

O2S HEATER FEED CIRCUIT OPEN

O2S HEATER GROUND CIRCUIT OPEN

WIRING HARNESS INTERMITTENT PROBLEM

O2 SENSOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTCs. Is the Good Trip Counter displayed and equal to zero? Yes → Go To 2 No → Go To 14	All

P1195-1/1 O2 SENSOR SLOW DURING CATALYST MONITOR — Continued

TEST	ACTION	APPLICABILITY
2	<p>Turn the ignition on. With the DRBIII®, actuate the O2 HEATER TEST. Monitor the O2 Sensor voltage on the DRBIII®. (O2S voltage should drop below 1.5 volts within 2-3 minutes) Does the DRBIII® O2 Sensor voltage drop below 1.5 volts within 2-3 minutes during the O2 HEATER TEST</p> <p>Yes → Go To 3</p> <p>No → Go To 7</p>	All
3	<p>Start the engine and allow engine to idle. Check for any exhaust leaks between the engine and the appropriate O2S. Check for exhaust leaks between the engine and the appropriate downstream O2 Sensor. Are there any exhaust leaks?</p> <p>Yes → Repair or replace leaking exhaust parts as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 4</p>	All
4	<p>Start engine. Allow the engine to reach normal operating temperature. Check the exhaust for excessive smoke from internal oil or coolant leaks. Is there an oil or coolant consumption condition present?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Using a Voltmeter, back probe the O2 Sensor Ground circuit between the O2 sensor harness connector and the PCM harness connector. Connect Voltmeter for positive polarity. Start the engine. Allow the engine to reach normal operating temperature. Is the voltage below 0.10 volt?</p> <p>Yes → Go To 6</p> <p>No → Repair high resistance on O2S Sensor Ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
6	<p>Turn the ignition off. Using a Voltmeter, back probe the O2 Sensor Signal circuit between the O2 Sensor harness connector and PCM harness connector. Start the engine. Allow the engine to reach normal operating temperature. Is the voltage below 0.10 volt?</p> <p>Yes → Go To 13</p> <p>No → Repair high resistance on O2S Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All

P1195-1/1 O2 SENSOR SLOW DURING CATALYST MONITOR — Continued

TEST	ACTION	APPLICABILITY
7	<p>Turn the ignition off. Disconnect the PCM harness connector(s). Turn the ignition on. With the DRBIII® actuate the O2 HEATER TEST. Measure the voltage at the O2 sensor harness connector Heater Feed circuit. Is the voltage above 11.0 volts?</p> <p>No → Repair the OPEN circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>Yes → Go To 8</p>	All
8	<p>Turn the ignition off. Disconnect the O2 sensor harness connector. Measure the resistance between the O2S Heater ground circuit and Engine Ground. Is the resistance below 5.0 ohms?</p> <p>No → Repair the OPEN circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>Yes → Go To 9</p>	All
9	<p>Turn the ignition off. Using a Voltmeter, back probe the O2 Sensor Signal circuit between the O2 Sensor harness connector and PCM harness connector. Start the engine. Allow the engine to reach normal operating temperature. Is the voltage below 0.10 volt?</p> <p>Yes → Go To 10</p> <p>No → Repair high resistance on O2S Signal circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
10	<p>Turn the ignition off. Using a Voltmeter, back probe the O2 Sensor Ground circuit between the O2 sensor harness connector and the PCM harness connector. Connect Voltmeter for positive polarity. Start the engine. Allow the engine to reach normal operating temperature. Is the voltage below 0.10 volt?</p> <p>Yes → Go To 11</p> <p>No → Repair high resistance on O2S Sensor Ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
11	<p>Start the engine and allow engine to idle. Check for any exhaust leaks between the engine and the appropriate O2S. Check for exhaust leaks between the engine and the appropriate downstream O2 Sensor. Are there any exhaust leaks?</p> <p>Yes → Repair or replace leaking exhaust parts as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 12</p>	All

P1195-1/1 O2 SENSOR SLOW DURING CATALYST MONITOR — Continued

TEST	ACTION	APPLICABILITY
12	<p>Start engine. Allow the engine to reach normal operating temperature. Check the exhaust for excessive smoke from internal oil or coolant leaks. Is there an oil or coolant consumption condition present?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 13</p>	All
13	<p>If there are no potential causes remaining, view repair.</p> <p>Repair</p> <p>Replace the O2S. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
14	<p>Start the engine and allow engine to idle. Check for any exhaust leaks between the engine and the appropriate O2S. Check for exhaust leaks between the engine and the appropriate downstream O2 Sensor. Are there any exhaust leaks?</p> <p>Yes → Repair or replace leaking exhaust parts as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 15</p>	All
15	<p>Start engine. Allow the engine to reach normal operating temperature. Check the exhaust for excessive smoke from internal oil or coolant leaks. Is there an oil or coolant consumption condition present?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Go To 16</p>	All
16	<p>Turn the ignition off.</p> <p>Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Note: Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Perform a wiggle test on the related wiring harnesses with the engine running. Watch for the Good Trip Counter to change to 0.</p> <p>Were any problems found?</p> <p>Yes → Repair wiring harness/connectors as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p> <p>No → Test Complete.</p>	All

Symptom:**P1281-ENGINE IS COLD TOO LONG****When Monitored and Set Condition:****P1281-ENGINE IS COLD TOO LONG**

When Monitored: The ignition key on, engine running.

Set Condition: The engine does not warm to 176 deg. F while driving for 20 minutes after start.

POSSIBLE CAUSES

ENGINE COLD TOO LONG

TEST	ACTION	APPLICABILITY
1	<p>Note: The best way to diagnose this DTC is to allow the vehicle to remain outside overnight in order to have a completely cold soaked engine.</p> <p>Note: Extremely cold outside ambient temperatures may cause this DTC to set.</p> <p>Verify that the coolant level is not low and correct as necessary.</p> <p>Start the engine.</p> <p>With the DRBIII®, set the engine RPM to 1500 and allow the engine to warm up for 10-15 minutes.</p> <p>With the DRBIII®, monitor the ENG COOLANT TMP DEG value during the warm up cycle. Make sure the transition of temperature change is smooth.</p> <p>Did the engine temperature reach a minimum of 80° C (176° F)?</p> <p>Yes → Test Complete.</p> <p>No → Refer to the Service Information for cooling system performance diagnosis. The most probable cause is a Thermostat problem. Also, refer to any related TSBs.</p> <p>Perform POWERTRAIN VERIFICATION TEST VER - 2.</p>	All

Symptom:

P1282-FUEL PUMP RELAY CONTROL CIRCUIT

When Monitored and Set Condition:

P1282-FUEL PUMP RELAY CONTROL CIRCUIT

When Monitored: With the ignition on and battery voltage above 10.4 volts.

Set Condition: An open or shorted condition is detected in the fuel pump relay control circuit.

POSSIBLE CAUSES

FUEL PUMP RELAY WIRING HARNESS OBSERVABLE
 FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
 FUEL PUMP RELAY
 FUEL PUMP RELAY CONTROL CIRCUIT OPEN
 FUEL PUMP RELAY CONTROL CIRCUIT SHORTED TO GROUND
 FUEL PUMP RELAY WIRING HARNESS INTERMITTENT
 POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, actuate the Fuel Pump Relay. Is the Fuel Pump Relay clicking? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition off. Using the wiring diagram as a guide, inspect the fuel pump relay wiring and connectors. Were any problems found? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 3	All
3	Turn the ignition on. With the DRBIII®, actuate the Fuel Pump Relay. Wiggle the wiring harness from the Fuel Pump Relay to the PCM while the relay is actuating. Did the Relay clicking stop or become irregular when wiggling the wires? Yes → Repair Circuit as necessary where wiggling caused clicking to stop or become irregular. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Test Complete.	All

P1282-FUEL PUMP RELAY CONTROL CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Remove the fuel pump relay from the PDC. Note: Check connectors - Clean/repair as necessary. Turn the ignition on. Measure the voltage on the fused ignition switch output circuit in the fuel pump relay connector. Is the voltage above 10.0 volts? Yes → Go To 5 No → Repair the open fused ignition switch output circuit. NOTE: Check for a blown fuse. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
5	Turn the ignition off. Remove the fuel pump relay. Note: Check connectors - Clean/repair as necessary. Measure the resistance between terminals 1 (85) and 2 (86) of the fuel pump relay. Is the resistance between 50 and 90 ohms? Yes → Go To 6 No → Replace the fuel pump relay. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
6	Turn the ignition off. Remove the fuel pump relay from the PDC. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance of the fuel pump relay control circuit between the fuel pump relay connector and the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the open fuel pump relay control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
7	Turn the ignition off. Remove the fuel pump relay from the PDC. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance between ground and the fuel pump relay control circuit. Is the resistance below 5.0 ohms? Yes → Repair the fuel pump relay control circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 8	All
8	If there are no possible causes remaining, view repair. Repair Replace the Powertrain Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

Symptom:

P1294-TARGET IDLE NOT REACHED

When Monitored and Set Condition:

P1294-TARGET IDLE NOT REACHED

When Monitored: With the engine idling and in drive, if automatic. There must not be a MAP sensor trouble code or a throttle position sensor trouble code.

Set Condition: Engine idle is not within 200 rpm above or 100 rpm below target idle for 14 seconds. Three separate failures are required to set a bad trip. Two bad trips are required to set the code.

POSSIBLE CAUSES

THROTTLE PLATES/LINKAGE BINDING

VACUUM LEAK

THROTTLE BODY

THROTTLE BODY DIRTY

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the Good Trip Counter displayed and equal to zero for P-1294? Yes → Go To 2 No → Test Complete.	All
2	Turn the ignition off. Check the throttle plates and linkage for a binding condition. The throttle linkages must be at idle position. Ensure the throttle plates are fully closed and against it's stops. Is the throttle plate and linkage free from defects? Yes → Go To 3 No → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
3	Inspect the Intake Manifold for vacuum leaks. Inspect the Power Brake Booster for any vacuum leaks. Inspect the PCV system for proper operation or any vacuum leaks. Were any problems found? Yes → Repair vacuum leak as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 4	All

P1294-TARGET IDLE NOT REACHED — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off.</p> <p>Disconnect the vacuum line at the PCV valve.</p> <p>Install Miller Tool #6714 (0.185" air metering orifice) into the disconnected vacuum line in place of the PCV valve.</p> <p>Disconnect the purge hose from the fitting on the throttle body. The purge hose is located on the front of the throttle body next to the MAP sensor. Cap the fitting at the throttle body after the purge hose has been disconnected.</p> <p>Start the engine. Ensure that all accessories are off. Allow the engine to reach operating temperature above 82°C (180°F).</p> <p>With the DRBIII® in System Tests, perform the "Minimum Air Flow" function.</p> <p>Is the engine RPM between 500 and 900?</p> <p>Yes → Test Complete.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off.</p> <p>Remove the Throttle Body.</p> <p>Warning: Clean throttle body in a well ventilated area. Wear rubber or butyl gloves. Do not let cleaner come in contact with eyes or skin. Avoid injecting cleaner. Wash thoroughly after using cleaner.</p> <p>While holding the throttle open, spray the entire throttle body bore and the manifold side of the throttle plate with Mopar Throttle Body Cleaner. Clean the IAC motor passage also. Use compressed air to dry the throttle body.</p> <p>Re-install the throttle body.</p> <p>Note: Miller Tool #6714 (0.185" air metering orifice) still attached to the PCV vacuum line and the purge hose fitting on the throttle body capped.</p> <p>Start the engine. Ensure that all accessories are off. Allow the engine to reach operating temperature above 82°C (180°F).</p> <p>With the DRBIII® in System Tests, perform the "Minimum Air Flow" function.</p> <p>Is the engine RPM between 500 and 900?</p> <p>Yes → Repair complete. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Test Complete.</p> <p>Caution: Stop all actuations. Turn engine off.</p>	All

Symptom:

P1296-NO 5 VOLTS TO MAP SENSOR

When Monitored and Set Condition:

P1296-NO 5 VOLTS TO MAP SENSOR

When Monitored: During power-down and battery voltage greater than 10.4 volts.

Set Condition: The MAP sensor signal voltage goes below 2.35 volts with the key off for 5 seconds.

POSSIBLE CAUSES

5 VOLT SUPPLY CIRCUIT

MAP SENSOR

MAP SENSOR WIRING HARNESS INTERMITTENT PROBLEM

MAP SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

PCM (5-VOLT SUPPLY)

TEST	ACTION	APPLICABILITY
1	<p>Note: If the PO107 - MAP Sensor Voltage Too Low is also set, diagnose it first before continuing with P1296 - No 5 Volts To MAP Sensor.</p> <p>Turn the ignition on. With the DRBIII® in Sensors, read the MAP sensor voltage.. Is the voltage below 2.35 volts?</p> <p>Yes → Go To 2 No → Go To 6</p>	All
2	<p>Turn the ignition off. Disconnect the MAP Sensor harness connector. Measure the voltage of the 5 Volt Supply circuit at the MAP Sensor harness connector. Is the voltage above 4.5 volts?</p> <p>Yes → Go To 3 No → Repair the 5 Volt Supply circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
3	<p>Turn the ignition off. Disconnect the MAP Sensor harness connector. Turn the ignition on. With the DRBIII® in Sensors, read the MAP Sensor voltage. Is the voltage above 4.5?</p> <p>Yes → Replace the MAP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 4</p>	All

P1296-NO 5 VOLTS TO MAP SENSOR — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the MAP Sensor Electrical harness connector. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the MAP Sensor 5-volt Supply Circuit for resistance to ground. Is the resistance below 5.0 ohms? Yes → Repair the 5-volt Supply Circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	If there are no possible causes remaining, view repair. Repair Replace the Powertrain Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	Start the engine. With the DRBIII® in Sensors, read the MAP Sensor voltage. Wiggle MAP Sensor harness connector & wiring harness. Monitor the DRBIII® display. Was there any MAP Sensor voltage change? Yes → Repair the Harness or Connector that caused the voltage change. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.	All

Symptom:

P1297-NO CHANGE IN MAP FROM START TO RUN

When Monitored and Set Condition:

P1297-NO CHANGE IN MAP FROM START TO RUN

When Monitored: With engine RPM +/- 64 of target idle and the throttle blade at closed throttle.

Set Condition: Too small of a difference is seen between barometric pressure with ignition on (engine running) and manifold vacuum for 8.80 seconds.

POSSIBLE CAUSES

MAP SENSOR TOO LOW CODE SET
 MAP SENSOR WIRING HARNESS INTERMITTENT PROBLEM
 VACUUM PORTS RESTRICTED
 MAP SENSOR 5-VOLT SUPPLY CIRCUIT OPEN
 MAP SENSOR (NO PRESS CHANGE)
 MAP SENSOR (PRESS CHANGE)
 MAP SENSOR RESTRICTED

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTCs. Is the MAP Sensor Voltage Too Low code set? Yes → Refer to symptom P0107 MAP SENSOR VOLTS TOO LOW in the DRIVEABILITY category. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 2	All
2	Turn the ignition on. With the DRBIII®, erase DTCs. Start engine and allow engine to idle for 30 seconds. With the DRBIII®, read DTCs. Does the DRBIII® display No Change In MAP From Start To Run? Yes → Go To 3 No → Go To 6	All
3	Turn the ignition off. Disconnect the MAP Sensor harness connector. Disconnect the PCM harness connector(s). Measure the resistance of the MAP Sensor 5-Volt Supply Circuit between the MAP Sensor harness connector to the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the 5-volt supply circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P1297-NO CHANGE IN MAP FROM START TO RUN — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Remove the MAP Sensor and inspect condition of vacuum port. Inspect condition of Intake Manifold or Throttle Body vacuum port. Was there a restriction? Yes → Remove the restriction and reinstall the MAP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5	All
5	If there are no possible causes remaining, view repair. Repair Replace the MAP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
6	Start the engine. With the DRBIII®, set the engine speed to 1500 RPM. With the engine RPM at 1500, read MAP Sensor voltage. While monitoring the voltage, wiggle the wiring from the MAP Sensor to PCM. Did the engine stall or voltage become erratic? Yes → Repair the Wiring or Connector defect between the MAP Sensor and the PCM. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 7	All
7	Start the engine. While monitoring engine vacuum on the DRBIII® display, quickly open and close throttle several times. Did the Vacuum drop below 1.0"? Yes → Test Complete. No → Go To 8	All
8	Turn the ignition off. Remove the MAP Sensor and inspect condition of vacuum port. Inspect condition of Intake Manifold or Throttle Body Vacuum Port. Is there a restriction or defect in the vacuum ports? Yes → Repair the restricted vacuum ports. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 9	All
9	If there are no potential causes remaining, view repair. Repair Replace the MAP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

Symptom:

P1388-AUTO SHUTDOWN RELAY CONTROL CIRCUIT

When Monitored and Set Condition:

P1388-AUTO SHUTDOWN RELAY CONTROL CIRCUIT

When Monitored: With ignition key on and battery voltage above 10.4 volts.

Set Condition: An open or shorted condition is detected in the ASD relay control circuit.

POSSIBLE CAUSES	
WIRING HARNESS INTERMITTENT PROBLEM	
FUSED IGNITION SWITCH OUTPUT CIRCUIT	
ASD RELAY CONTROL CIRCUIT OPEN	
ASD RELAY CONTROL CIRCUIT SHORTED TO GROUND	
ASD RELAY CONTROL CIRCUIT	

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTCs. Is the DTC Specific Good Trip Counter displayed and equal to zero? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Remove the ASD relay from the PDC. Disconnect the PCM harness connector(s). Measure the resistance of the ASD relay control circuit from the ASD relay cavity in PDC to the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open ASD relay control circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
3	Turn the ignition off. Remove the ASD relay from the PDC. Turn the ignition on. Measure the fused ignition switch output circuit at the ASD Relay connector. Is the voltage above 10.0 volts? Yes → Go To 4 No → Repair the open Fused Ignition Output circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

P1388-AUTO SHUTDOWN RELAY CONTROL CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Remove the ASD relay from the PDC. Disconnect the PCM harness connector(s). Measure the ASD relay control circuit to ground. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the ASD Relay control circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Remove the ASD relay from the PDC. Measure the resistance between terminals 85 and 86 of the ASD relay. Is the resistance between 50 and 80 ohms?</p> <p>Yes → Replace the PCM Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Replace the ASD Relay. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p>	All
6	<p>At this time, the conditions required to set the DTC are not present. Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Note: Refer to any technical service bulletins that may apply. Perform a wiggle test on the related wiring harnesses with the engine running. Watch for the Good Trip Counter to change to 0. Were any problems found?</p> <p>Yes → Repair wiring harness/connectors as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Test Complete.</p>	All

Symptom:

P1389-NO ASD RELAY OUTPUT VOLTAGE AT PCM

When Monitored and Set Condition:

P1389-NO ASD RELAY OUTPUT VOLTAGE AT PCM

When Monitored: With ignition key on, battery voltage above 10.4 volts, and engine RPM greater than 400.

Set Condition: No voltage sensed at the PCM when the ASD relay is energized.

POSSIBLE CAUSES

WIRING HARNESS INTERMITTENT PROBLEM

ASD RELAY OUTPUT CIRCUIT OPEN

ASD RELAY OUTPUT CIRCUIT OPEN

FUSED B+ CIRCUIT OPEN

ASD RELAY

PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTCs. Is the Good Trip Counter displayed and equal to zero? Yes → Go To 2 No → Go To 8	All
2	Attempt to start the engine. Did the engine start? Yes → Go To 3 No → Go To 5	All
3	Turn the ignition off. Remove the ASD relay from the PDC. Disconnect the PCM harness connector(s). Measure the resistance of the ASD relay output circuit from the ASD Relay cavity in PDC to the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open ASD Relay output circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
4	If there are no possible causes remaining, view repair. Repair Replace the Powertrain Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

P1389-NO ASD RELAY OUTPUT VOLTAGE AT PCM — Continued

TEST	ACTION	APPLICABILITY
5	Turn the ignition off. Remove the ASD relay from the PDC. Disconnect the PCM harness connector(s). Measure the resistance of the ASD relay output circuit from the ASD Relay cavity in PDC to the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 6 No → Repair the open ASD Relay output circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
6	Turn the ignition off. Remove the ASD relay from the PDC. Measure the Fused B+ circuit at the ASD Relay connector. Is the voltage above 10.0 volts? Yes → Go To 7 No → Repair the open fused B+ circuit. Note: Check fuse in the PDC. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
7	Install a substitute relay for the Auto Shutdown Relay. Attempt to start the vehicle. Did the engine start? Yes → Replace the ASD Relay. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Test Complete.	All
8	At this time, the conditions required to set the DTC are not present. Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Note: Refer to any technical service bulletins that may apply. Perform a wiggle test on the related wiring harnesses with the engine running. Watch for the Good Trip Counter to change to 0. Were any problems found? Yes → Repair wiring harness/connectors as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Test Complete.	All

Symptom:

P1391-INTERMITTENT LOSS OF CMP OR CKP

When Monitored and Set Condition:

P1391-INTERMITTENT LOSS OF CMP OR CKP

When Monitored: Engine running or cranking.

Set Condition: When the failure counter reaches 20 for 2 consecutive trips.

POSSIBLE CAUSES

CMP SENSOR OUT OF SYNC
 DAMAGED TONE WHEEL/FLEX PLATE (CRANKSHAFT)
 DAMAGED TONE WHEEL/PULSE RING (CAMSHAFT)
 IRREGULAR LAB SCOPE PATTERN OF CMP SIGNAL
 INTERMITTENT CKP SIGNAL LOSS WHEN WIRING IS WIGGLED
 IRREGULAR LAB SCOPE PATTERN OF CKP SIGNAL
 WIRING HARNESS INTERMITTENT
 INTERMITTENT CMP SIGNAL LOSS WHEN WIRING IS WIGGLED
 SENSOR CONNECTOR/WIRING
 SENSOR CONNECTOR/WIRING
 CAMSHAFT POSITION SENSOR
 CKP SENSOR CONNECTOR/WIRING
 CRANKSHAFT POSITION SENSOR

TEST	ACTION	APPLICABILITY
1	Turn ignition on. With the DRBIII®, read DTCs. Is the DTC Good Trip Counter displayed and equal to zero for P1391? Yes → Go To 2 No → Go To 14	All
2	Warning: When performing the following test, the engine will be running. Be careful not to stand in line with the fan blades or fan belt. Do not wear loose clothing. Start the engine and run until operating temp is reached. (Closed Loop) With the DRBIII® under the Misc. menu, choose the "Set Sync Signal" function and observe the "Actual Sync Setting." Does the "Actual Sync Setting" read "In Range"? Yes → Go To 3 No → Loosen the CMP sensor base hold down bolt and turn the base until the sync is "IN RANGE" on the DRBIII®. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P1391-INTERMITTENT LOSS OF CMP OR CKP — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn ignition off. With the DRBIII® lab scope, back probe the CMP signal circuit at the CMP sensor harness connector using Miller special tool #6801. Warning: Keep clear of the engine's moving parts. Start the engine. Observe the CMP sensor voltage pattern on the lab scope screen. Are there any signals missing?</p> <p>Yes → Go To 4 No → Go To 7</p>	All
4	<p>Turn the ignition off. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Note: Make sure the Camshaft Position Sensor and/or the Crankshaft Position Sensor is tight. Note: Refer to any technical service bulletins that may apply. Were any problems found?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect and remove the camshaft position sensor. Inspect the tone wheel/pulse ring for looseness and/or physical damage. Is the tone wheel/pulse ring free from defects?</p> <p>Yes → Go To 6 No → Repair/replace tone wheel/pulse ring as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
6	<p>If there are no possible causes remaining, view repair.</p> <p>Repair Replace the Camshaft Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All
7	<p>Turn the ignition off. With the DRBIII® lab scope, back probe the CKP signal circuit at the CKP sensor harness connector using Miller special tool #6801. Warning: Keep clear of the engine's moving parts. Start the engine. Observe the CKP sensor voltage pattern on the lab scope screen. Are there any signals missing?</p> <p>Yes → Go To 8 No → Go To 11</p>	All

Symptom:

P1398-MIS-FIRE ADAPTIVE NUMERATOR AT LIMIT

When Monitored and Set Condition:

P1398-MIS-FIRE ADAPTIVE NUMERATOR AT LIMIT

When Monitored: Under closed throttle decel with A/C off, ECT above 75, and more than 50 seconds after engine start.

Set Condition: One of the CKP sensor target windows has more than 2.86% variance from the reference window.

POSSIBLE CAUSES

DAMAGED TONE WHEEL/FLEX PLATE (CRANKSHAFT)

SENSOR CONNECTOR/WIRING

CKP SENSOR CONNECTOR/WIRING

CRANKSHAFT POSITION SENSOR

IMPROPERLY INSTALLED/LOOSE CRANKSHAFT POSITION SENSOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTCs. Is the DTC Specific Good Trip Counter displayed and equal to zero for P-1398? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition off. Note: Visually inspect the Crankshaft Position Sensor and related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Note: Make sure the sensor mounting bolt(s) are tight. Were any problems found? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 3	All
3	Turn the ignition off. Disconnect the Crankshaft Position Sensor harness connector. Note: Visually inspect the related wiring harness/connectors. Look for broken, bent, pushed out or corroded terminals. Inspect the Crankshaft Position Sensor for proper installation and tightness. Is the Crankshaft Position Sensor properly installed and the mounting bolt(s) tight? Yes → Go To 9 No → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

P1398-MIS-FIRE ADAPTIVE NUMERATOR AT LIMIT — Continued

TEST	ACTION	APPLICABILITY
4	<p>Note: Check for any TSB's that may apply to this symptom. Read and record the Freeze Frame Data. Use this information to help you duplicate the conditions that set the DTC. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load. Turn the ignition on. With the DRBIII® in the miscellaneous menu, choose "Clear PCM (battery disconnect)" to reset the PCM. With the DRBIII®, choose the "Misfire Pretest screen. Road test the vehicle and re-learn the adaptive numerator. The adaptive numerator is learned when the "Adaptive Numerator Done Learning" line on the Mis-fire Pre-test screen changes to "Yes". Did the adaptive numerator re-learn?</p> <p>Yes → Go To 5 No → Go To 6</p>	All
5	<p>Turn ignition off. Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Note: Make sure the Camshaft Position Sensor and/or the Crankshaft Position Sensor is tight. Note: Refer to any technical service bulletins that may apply. Were any problems found?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Test Complete.</p>	All
6	<p>Turn the ignition off. Note: Visually inspect the Crankshaft Position Sensor and related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Note: Make sure the sensor mounting bolt(s) are tight. Were any problems found?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 7</p>	All
7	<p>Turn the ignition off. Disconnect the Crankshaft Position Sensor harness connector. Note: Visually inspect the related wiring harness/connectors. Look for broken, bent, pushed out or corroded terminals. Inspect the Crankshaft Position Sensor for proper installation and tightness. Is the Crankshaft Position Sensor properly installed and the mounting bolt(s) tight?</p> <p>Yes → Go To 8 No → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	All

Symptom:**P1486-EVAP LEAK MONITOR PINCHED HOSE FOUND****When Monitored and Set Condition:****P1486-EVAP LEAK MONITOR PINCHED HOSE FOUND**

When Monitored: Immediately after a cold start, with battery/ambient temperature between 40 deg. F and 90 deg. F and coolant temperature within 10 deg. F of battery/ambient.

Set Condition: LDP test must pass first. If the PCM suspects a pinched hose it will not set a fault until it runs the evap purge flow monitor. If the purge monitor does not pass then the pinched hose fault will be set.

POSSIBLE CAUSES

EVAP CANISTER OBSTRUCTED

LDP PRESSURE HOSE OBSTRUCTED

LEAK DETECTION PUMP

INTERMITTENT LDP MONITOR FAILURE

OBSTRUCTION IN EVAP SYSTEM BETWEEN EVAP CANISTER AND FUEL TANK

OBSTRUCTION IN HOSE/TUBE BETWEEN EVAP CANISTER AND PURGE SOLENOID

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the DTC Good Trip Counter displayed and equal to zero for P1486? Yes → Go To 2 No → Go To 7	All

P1486-EVAP LEAK MONITOR PINCHED HOSE FOUND — Continued

TEST	ACTION	APPLICABILITY
2	<p>To continue testing you will need Miller Tools #6872A (Evap System Pressure Pump) and #8382 (Gas Cap Tester/Adapter).</p> <p>Warning: The test equipment is designed to be used to pressurize the vehicles Evaporative System only. Using the equipment in a manner for which it was not designed could be harmful.</p> <p>Warning: Keep lighted cigarettes, sparks, flames, and other ignition sources away from the test area to prevent the ignition of explosive gases. Keep the test area well ventilated.</p> <p>Note: The fuel tank should have between 20% & 80% of full to properly test the Evap system.</p> <p>Attach the power source clip (red) of Miller Tool #6872A to Battery (+) and the ground clip (black) to Battery (-).</p> <p>Perform the Evaporative System Pressure Pump self test that is specified on the tester cover.</p> <p>Remove gas cap and install Miller Tool #8382 on vehicle. Install gas cap to Miller Tool #8382. Attach the pressure supply hose from Miller Tool #6872A to the fitting on #8382.</p> <p>Disconnect the vacuum supply hose at the Leak Detection Pump. Connect and apply a continuous vacuum supply (i.e. 20"Hg) to the Leak Detection Pump. A vacuum pump such as an A/C recovery unit works well.</p> <p>Ignition on, engine not running.</p> <p>With the DRBIII® in System Tests, select "Leak Detect Pump Test." Read instructions and then press Enter. Select: #3 - HOLD PSI.</p> <p>On Miller Tool #6872A, set the Pressure/Hold switch to Open and set the Vent switch to Closed. Turn the pump timer On and watch the gauge.</p> <p>When the gauge pressure reaches 14"H₂O, turn the Pressure/Hold Valve to Closed. Turn the pump timer off.</p> <p>Disconnect the hose at the EVAP Canister that goes to the Fuel Tank.</p> <p>Did the pressure drop when the hose was disconnected?</p> <p>Yes → Go To 3</p> <p>No → Repair obstruction in the EVAP system between the EVAP Canister and the fuel tank.</p>	All
3	<p>Note: All previously disconnected hose(s) reconnected.</p> <p>Re-pressurize the EVAP System. On Miller Tool #6872A, set the Pressure/Hold switch to Open and set the Vent switch to Closed. Turn the pump timer On and watch the gauge.</p> <p>When the gauge pressure reaches 14"H₂O, turn the Pressure/Hold Valve to Closed. Turn the pump timer off.</p> <p>Disconnect the LDP Pressure hose at the EVAP Canister. The LDP Pressure hose is the hose that connects the Evap Canister to the Leak Detection Pump.</p> <p>Did the pressure drop when the hose was disconnected?</p> <p>Yes → Go To 4</p> <p>No → Replace the EVAP Canister.</p>	All

P1486-EVAP LEAK MONITOR PINCHED HOSE FOUND — Continued

TEST	ACTION	APPLICABILITY
4	<p>Note: All previously disconnected hose(s) reconnected. Re-pressurize the EVAP System. On Miller Tool #6872A, set the Pressure/Hold switch to Open and set the Vent switch to Closed. Turn the pump timer On and watch the gauge. When the gauge pressure reaches 14"H₂O, turn the Pressure/Hold Valve to Closed. Turn the pump timer off. Disconnect the EVAP hoses at the Purge Solenoid. Did the pressure drop when the hose was disconnected?</p> <p>Yes → Go To 5</p> <p>No → Repair or replace hose/tube as necessary.</p>	All
5	<p>Disconnect and remove the LDP pressure hose. The LDP pressure hose is the hose that connects the EVAP Canister to the Leak Detection Pump. Inspect the LDP pressure hose for any obstructions or physical damage. Is the LDP pressure hose free from defects?</p> <p>Yes → Go To 6</p> <p>No → Repair/replace hose as necessary.</p>	All
6	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Leak Detection Pump.</p>	All
7	<p>At this time, the conditions required to set the DTC are not present. Note: Use the Freeze Frame Data to help you duplicate the conditions that set the DTC. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load. Note: A thorough visual inspection of the Evap system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may aid diagnosis also. Note: Refer to any Technical Service Bulletins (TSB's) that may apply. With the DRBIII® in System Tests, perform the LDP Monitor Test. This will force the PCM to run the LDP Monitor. If the monitor fails, further diagnosis is required to find faulty component. If the monitor passes, the condition is not present at this time. Were any problems found?</p> <p>Yes → Repair as necessary.</p> <p>No → Test Complete.</p>	All

Symptom:

P1494-LEAK DETECTION PUMP SW OR MECHANICAL FAULT

When Monitored and Set Condition:

P1494-LEAK DETECTION PUMP SW OR MECHANICAL FAULT

When Monitored: Immediately after a cold start, with battery/ambient temperature between 40 deg. F and 90 deg. F and coolant temperature within 10 deg. F of battery/ambient.

Set Condition: The state of the switch does not change when the solenoid is energized.

POSSIBLE CAUSES

WIRING HARNESS INTERMITTENT
LDP SWITCH SENSE CIRCUIT SHORTED TO GROUND
LDP VACUUM SUPPLY
LEAK DETECTION PUMP
LDP SWITCH SENSE CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the DTC Good Trip Counter displayed and equal to zero for P-1494? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition off. Disconnect the vacuum supply hose at the Leak Detection Pump. Connect a vacuum gauge to the disconnected vacuum supply hose at the Leak Detection Pump. Start the engine and read the vacuum gauge. Does the vacuum gauge read at least 13 in/Hg? Yes → Go To 3 No → Repair leak or obstruction in vacuum hose as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 6.	All

P1494-LEAK DETECTION PUMP SW OR MECHANICAL FAULT — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Leak Detection Pump harness connector. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance of the LDP Switch Sense Circuit from the PCM harness connector to LDP harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 4</p> <p>No → Repair the open Leak Detection Pump Switch Sense Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 6.</p>	All
4	<p>Turn the ignition off. Disconnect the Leak Detection Pump electrical harness connector. Turn the ignition on. With the DRBIII® in Inputs/Outputs, read the "Leak Detect Pump Sw" state. While observing the "Leak Detect Pump Sw" state, connect a jumper wire between a good 12 volt source (B+) and the LDP Switch Sense circuit. Did the "Leak Detect Pump Sw" state change when the jumper was connected?</p> <p>Yes → Replace the Leak Detection Pump. Perform POWERTRAIN VERIFICATION TEST VER - 6.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the Leak Detection Pump electrical harness connector. Disconnect the PCM harness connector(s). Measure the resistance between the LDP Switch Sense circuit and ground. Is the resistance below 5.0 Ohms?</p> <p>Yes → Repair the LDP Switch Sense Circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 6.</p> <p>No → Go To 6</p>	All
6	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Powertrain Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 6.</p>	All
7	<p>At this time, the conditions required to set the DTC are not present. Note: Use the Freeze Frame Data to help you duplicate the conditions that set the DTC. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load. Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Note: Refer to any Technical Service Bulletins (TSB's) that may apply. Perform a wiggle test of the LDP wiring while the circuit is actuated with the DRBIII®. Listen for the LDP to quit actuating. Also watch for the Good Trip Counter to change to 0. Were any problems found?</p> <p>Yes → Repair wiring harness/connectors as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 6.</p> <p>No → Test Complete.</p>	All

Symptom:

P1495-LEAK DETECTION PUMP SOLENOID CIRCUIT

When Monitored and Set Condition:

P1495-LEAK DETECTION PUMP SOLENOID CIRCUIT

When Monitored: Ignition on and battery voltage greater than 10.4 volts.

Set Condition: The state of the solenoid circuit does not match the PCM's desired state.

POSSIBLE CAUSES

LDP SOLENOID CIRCUIT WIRING HARNESS OBSERVABLE
 LDP SOLENOID CKT WIRING HARNESS INTERMITTENT
 GENERATOR SOURCE CIRCUIT OPEN
 LDP SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
 LEAK DETECTION PUMP
 LEAK DETECTION PUMP SOLENOID CONTROL CIRCUIT OPEN
 POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Is the DTC Good Trip Counter displayed and equal to zero for P-1495? Yes → Go To 2 No → Go To 8	All
2	Turn the ignition off. Disconnect the Leak Detection Pump electrical harness connector. Turn the ignition on. With the DRBIII®, actuate the Leak Detection Pump. Using a 12 volt test light connected to ground (B-), check the Generator Source Circuit at the LDP connector. Does the test light illuminate brightly? Yes → Go To 3 No → Repair the open Generator Source Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 6.	All
3	Turn the ignition off. Disconnect the Leak Detection Pump electrical harness connector. Connect a 12 volt test light to a good 12 volt source (B+). Turn the ignition on. With the DRBIII®, actuate the Leak Detection Pump. Check the LDP Solenoid Control circuit, with the test light, while the Leak Detection Pump is actuating. Does the test light blink? Yes → Go To 4 No → Go To 5	All

5	<p>Turn the ignition off. Disconnect the Leak Detection Pump electrical harness connector. Disconnect the PCM harness connector(s). Measure the resistance between the LDP Solenoid Control circuit and ground. Is the resistance below 5.0 Ohms?</p> <p>Yes → Repair the LDP Solenoid Control Circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 6.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off. Disconnect the Leak Detection Pump Solenoid harness connector. Disconnect the PCM harness connector(s).. Note: Check connectors - Clean/repair as necessary. Measure the resistance of the LDP Solenoid Control Circuit from the PCM harness connector to the LDP harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 7</p> <p>No → Repair the open Leak Detection Pump Solenoid Control Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 6.</p>	All
7	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>If there are no possible causes remaining, replace the PCM.</p>	All
8	<p>Turn the ignition off. Using the schematic as a guide, inspect the Wiring and Connectors. Were any problems found?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 6.</p> <p>No → Go To 9</p>	All
9	<p>Ignition on, engine not running. With the DRBIII®, actuate the LDP Solenoid. While wiggling the LDP Wiring Harness from the LDP Solenoid harness connector to PCM harness connector, listen to LDP Solenoid. Did the LDP Solenoid ever stop or start clicking?</p> <p>Yes → Repair as necessary where wiggling caused problem to appear. Perform POWERTRAIN VERIFICATION TEST VER - 6.</p> <p>No → Test Complete.</p>	All

Symptom:

P1696-PCM FAILURE EEPROM WRITE DENIED

POSSIBLE CAUSES
PCM FAILURE

Repair Instructions:**PCM FAILURE**

Replace and program the Powertrain Control Module Module in accordance with the Service Information.

Perform POWERTRAIN VERIFICATION TEST VER - 5.

Symptom:**P1899-P/N SWITCH PERFORMANCE**

POSSIBLE CAUSES
INTERMITTENT PARK/NEUTRAL SWITCH SENSE CIRCUIT
PARK/NEUTRAL POSITION SWITCH
PARK/NEUTRAL SWITCH SENSE CIRCUIT OPEN
PARK/NEUTRAL SWITCH SENSE CIRCUIT SHORTED TO GROUND
POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTCs. Is the Good Trip Counter for P-1899 displayed and equal to 0? Yes → Go To 2 No → Go To 7	All
2	Turn the ignition on. With the DRBIII®, read the PNP switch input state. While moving the gear selector through all gear positions (Park to 1st and back to Park), watch the DRB display. Did the DRBIII® display P/N and D/R in the correct gear positions? Yes → Test Complete. No → Go To 3	All
3	Turn the ignition off. Disconnect the PCM C1 harness connector. Disconnect the PNP switch harness connector. Check connectors - Clean/repair as necessary Measure the resistance of the PNP switch sense circuit between the PCM C1 harness connector and the PNP switch harness connector. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the PNP switch sense circuit for an open. Perform AW4 TRANS VERIFICATION TEST-VER1.	All
4	Turn the ignition off. Disconnect the PCM C1 harness connector. Disconnect the PNP switch harness connector. Check connectors - Clean/repair as necessary Measure the resistance between ground and the PNP switch sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the PNP switch sense circuit for a short to ground. Perform AW4 TRANS VERIFICATION TEST-VER1. No → Go To 5	All

P1899-P/N SWITCH PERFORMANCE — Continued

TEST	ACTION	APPLICABILITY
5	<p>Turn the ignition off. Disconnect the PCM C1 harness connector. Check connectors - Clean/repair as necessary Move the gear selector through all gear positions, from Park to 1st and back. While moving the gear selector through the gear positions, measure the resistance between ground and the PNP switch sense circuit in the PCM C1 harness connector. Did the display change from above 10.0 ohms to below 10.0 ohms?</p> <p>Yes → Go To 6</p> <p>No → Replace the Park/Neutral Position Switch in accordance with the Service Information. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All
6	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Powertrain Control Module. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All
7	<p>At this time, the conditions required to set the DTC are not present. Note: Use the Freeze Frame Data to help duplicate the conditions that set the DTC. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load. Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Note: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Note: Refer to any technical service bulletins that may apply. Were any problems found?</p> <p>Yes → Repair as necessary. Perform AW4 TRANS VERIFICATION TEST-VER1.</p> <p>No → Test Complete.</p>	All

Symptom:***CHECKING EVAPORATIVE EMISSION OPERATION WITH NO DTC'S****POSSIBLE CAUSES**

PURGE SYSTEM CONTAMINATED
 ROLLOVER VALVE
 VACUUM HARNESS INTERMITTENT
 WIRING HARNESS INTERMITTENT

TEST	ACTION	APPLICABILITY
1	<p>Start the engine, Allow the engine to reach normal operating temperature. Note: Engine must be in closed loop. With the DRBIII®, go to Purge Vapors Test. Press 3 to flow. Note: Short Term Adaptive should change. Did Short Term Adaptive change?</p> <p>Yes → Test Complete. No → Go To 2</p>	All
2	<p>At this time, the conditions required to set the DTC are not present. Note: Use the Freeze Frame Data to help you duplicate the conditions that set the DTC. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load. Note: Visually inspect the Evap Purge Solenoid and vacuum harness. Look for any chafed, pierced, pinched, or partially broken hoses. Note: Refer to any technical service bulletins that may apply. Were any problems found?</p> <p>Yes → Repair vacuum harness/connections as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 3</p>	All
3	<p>At this time, the conditions required to set the DTC are not present. Note: Use the Freeze Frame Data to help you duplicate the conditions that set the DTC. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load. Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Note: Refer to any technical service bulletins that may apply. Perform a wiggle test of the Evap Purge Solenoid wiring while the circuit is actuated with the DRBIII®. Listen for the solenoid to quit actuating. Also watch for the Good Trip Counter to change to 0. Were any problems found?</p> <p>Yes → Repair wiring harness/connectors as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 4</p>	All

***CHECKING EVAPORATIVE EMISSION OPERATION WITH NO DTC'S — Continued**

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Remove the Purge Solenoid. Inspect the line from rollover valve to the solenoid. Is liquid fuel in the line? Yes → Replace the Rollover Valve. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 5	All
5	Turn the ignition off. Remove the Purge solenoid and tap the ports against a clean solid surface. Did any foreign material fall out? Yes → Replace the purge solenoid and clean or replace the vacuum and purge lines and Evap canister. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Test Complete.	All

Symptom:***CHECKING FUEL DELIVERY**

POSSIBLE CAUSES
FUEL PUMP RELAY
FUEL PRESSURE OUT OF SPECS
RESTRICTED FUEL SUPPLY LINE
FUEL PUMP INLET STRAINER PLUGGED
FUEL PUMP MODULE
FUEL PUMP CAPACITY (VOLUME) OUT OF SPECS
FUEL PUMP RELAY FUSED B+ CIRCUIT
FUEL PUMP RELAY OUTPUT CIRCUIT OPEN
FUEL PUMP GROUND CIRCUIT OPEN/HIGH RESISTANCE
FUEL PUMP MODULE

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test. Note: It may be necessary to use a mechanics stethoscope in the next step. Listen for fuel pump operation at the fuel tank. Does the Fuel Pump operate?</p> <p>Yes → Go To 2</p> <p>No → Go To 6</p> <p>Caution: Stop All Actuations.</p>	All
2	<p>Turn the ignition off. WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Install a fuel pressure gauge to the fuel rail test port. Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge. NOTE: Fuel pressure specification is 339.2 KPa +/- 34 KPa (49.2 psi +/- 5 psi). Choose a conclusion that best matches your fuel pressure reading.</p> <p>Below Specification Go To 3</p> <p>Within Specification Go To 5</p> <p>Above Specification Replace the fuel filter/fuel pressure regulator. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>Caution: Stop All Actuations.</p>	All

*CHECKING FUEL DELIVERY — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off.</p> <p>WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module. Install special 5/16" fuel line adapter tool #6539 between disconnected fuel line and the fuel pump module.</p> <p>Attach a fuel pressure test gauge to the "T" fitting on tool #6539.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge.</p> <p>NOTE: Fuel pressure specification is 339.2 KPa +/- 34 KPa (49.2 psi +/- 5 psi).</p> <p>Is the fuel pressure within specification now?</p> <p>Yes → Repair/replace fuel supply line as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Go To 4</p> <p>Caution: Stop All Actuations.</p>	All
4	<p>Turn the ignition off.</p> <p>WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.</p> <p>Is the Fuel Inlet Strainer plugged?</p> <p>Yes → Replace the Fuel Pump Inlet Strainer. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Replace the Fuel Pump. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
5	<p>Note: The fuel pressure must be within specification before continuing.</p> <p>Turn the ignition off.</p> <p>WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>Disconnect the fuel supply line at the fuel rail.</p> <p>Connect fuel line adapter #6539(5/16") or #6631(3/8") to the disconnected fuel supply line. Insert the other end of the adapter into a graduated container.</p> <p>Caution: Do not operate the fuel pump for more than 7 seconds in the next step. Fuel pump module reservoir may run empty and damage to the fuel pump will result.</p> <p>Note: Specification: A good fuel pump will deliver at least 1/4 liter (1/2 pint) of fuel in 7 seconds.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, actuate the ASD Fuel System test for 7 seconds.</p> <p>Is the fuel pump capacity within specification?</p> <p>Yes → Test Complete.</p> <p>No → Check for a kinked/damaged fuel supply line between the fuel tank and fuel rail. If OK, replace the fuel pump module. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>Caution: Stop All Actuations.</p>	All

***CHECKING FUEL DELIVERY — Continued**

TEST	ACTION	APPLICABILITY
6	<p>Turn the ignition off. Disconnect the fuel pump module harness connector. Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test. Using a 12 volt test light connected to ground, probe the Fuel Pump Relay Output circuit at the Fuel Pump Module harness connector. Does the test light illuminate brightly?</p> <p>Yes → Go To 7</p> <p>No → Go To 9</p> <p>Caution: Stop All Actuations.</p>	All
7	<p>Turn the ignition off. Disconnect the Fuel Pump Module harness connector. Note: Check connectors - It is critical that the connector is free from any signs of corrosion or deformities - Clean/repair as necessary. Using a test light connected to battery voltage, probe the Fuel Pump ground circuit at the Fuel Pump Module harness connector. Does the test light illuminate brightly?</p> <p>Yes → Go To 8</p> <p>No → Repair the open/high resistance in the fuel pump ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
8	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the Fuel Pump Module. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
9	<p>Turn the ignition off. Remove the Fuel Pump Relay from the PDC. With a 12 volt test light connected to ground, probe the Fuel Pump Relay Fused B+ circuit at the PDC. Does the test light illuminate?</p> <p>Yes → Go To 10</p> <p>No → Repair the Fuel Pump Realy Fused B+ circuit. Check for open fuse in the PDC. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
10	<p>Turn the ignition off. Remove the Fuel Pump Relay from the PDC. Disconnect the Fuel Pump Module harness connector. NOTE: Check connectors - It is critical that the connector is free from any signs of corrosion or deformities Measure the resistance of the Fuel Pump Relay Output circuit from the relay connector to the fuel pump module connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Replace the Fuel Pump Relay Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Repair the Fuel Pump Relay Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All

Symptom:

*CHECKING IAC MOTOR

POSSIBLE CAUSES
IAC MOTOR OPERATION
IAC DRIVER CIRCUITS OPEN
IAC MOTOR

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. With the DRBIII®, monitor engine RPM. With the DRBIII®, set the engine speed to 1400 RPM. Does the engine speed reach 1400 rpm?</p> <p>Yes → The IAC Motor is operation normally Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition off. Disconnect IAC Motor harness connector. Disconnect the PCM harness connector. Repeat each measurement for each IAC Driver circuit. Measure the resistance of each IAC Driver circuit between the IAC Motor harness connector and the PCM harness connector. Is the resistance below 5.0 ohms at all IAC Driver circuits?</p> <p>Yes → Replace the IAC Motor. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Repair the IAC Driver circuit(s) for an open. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p>	All

Symptom:***CHECKING MAP SENSOR OPERATION WITH NO DTC'S****POSSIBLE CAUSES**

MAP SENSOR OPERATION

MAP SENSOR

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Attach a vacuum gauge to a manifold vacuum source. NOTE: If the engine will not idle, maintain a constant engine speed above idle. Allow the engine to idle. With the DRBIII®, monitor the MAP sensor vacuum. Compare the MAP vacuum value on the DRBIII® and the vacuum reading on the vacuum gauge. Are the vacuum readings within 1 inch of vacuum of each other? Yes → Test Complete. No → Replace the MAP sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

Symptom:

*CHECKING MINIMUM AIRFLOW

POSSIBLE CAUSES

CHECKING THE MINIMUM AIRFLOW

TEST	ACTION	APPLICABILITY
1	<p>Start engine and bring to operating temperature. Be sure all accessories are off before performing this test.</p> <p>Shut off engine and remove air duct and air resonator box from top of throttle body.</p> <p>Disconnect rear CCV breather tube at intake manifold fitting. Let CCV tube hang disconnected at side of engine.</p> <p>Attach a short piece of rubber hose to special tool 6714. Install this hose/tool assembly to intake manifold fitting.</p> <p>Connect the DRBIII®.</p> <p>Start the Engine.</p> <p>Using the DRBIII®, run the Minimum Air Flow test.</p> <p>The DRBIII® will count down to stabilize the idle rpm and display the minimum air flow idle rpm. The idle rpm should be between 500 and 900 rpm. If the idle speed is outside of these specifications, replace the throttle body.</p> <p>Is the engine rpm between 500 and 900 rpm?</p> <p>Yes → Test Complete.</p> <p>No → Replace the throttle body.</p> <p>Perform POWERTRAIN VERIFICATION TEST VER - 5.</p>	4.0L MPI I-6

Symptom:***CHECKING RADIATOR FAN OPERATION WITH NO DTC'S**

POSSIBLE CAUSES
FUSED B(+) CIRCUIT OPEN
RADIATOR FAN GROUND CIRCUIT OPEN
RAD FAN MOTOR
RADIATOR FAN RELAY OUTPUT CIRCUIT OPEN
RADIATOR FAN RELAY

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, actuate the Radiator Fan Relay. Does the Radiator Fan Motor cycle on and off? Yes → Test Complete. No → Go To 2	All
2	Turn the ignition on. With the DRBIII®, actuate the Radiator Fan Relay. Using a 12-volt Test Light connected to ground, backprobe the Radiator Fan Relay Output circuit in the Radiator Fan Motor harness connector. Does the test light cycle on and off? Yes → Go To 3 No → Go To 5	All
3	Turn the ignition off. Disconnect the Radiator Fan Motor harness connector. Measure the resistance between ground and the Radiator Fan Motor Ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 4 No → Repair the open Radiator Fan Ground Circuit.	All
4	If there are no possible causes remaining, view repair. Repair Replace the Radiator Fan Motor.	All
5	Turn the ignition off. Disconnect the Radiator Fan Relay Connector. Using a 12-volt Test Light connected to ground, check the Fused B(+) circuit in the Radiator Fan Relay connector. Did the light illuminate brightly? Yes → Go To 6 No → Repair the open Fused B(+) Circuit (check Radiator Fan Fuse in PDC).	All

***CHECKING RADIATOR FAN OPERATION WITH NO DTC'S — Continued**

TEST	ACTION	APPLICABILITY
6	Turn the ignition off. Disconnect the Radiator Fan Motor harness connector. Remove Rad Fan Relay. Measure the resistance of the Radiator Fan Relay Output circuit. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the open Radiator Fan Relay Output Circuit.	All
7	If there are no possible causes remaining, view repair. Repair Replace the Radiator Fan Relay.	All

Symptom:***CHECKING RADIATOR FAN RELAY OUTPUT****POSSIBLE CAUSES**

RADIATOR FAN RELAY OPERATION

GROUND CIRCUIT OPEN

RADIATOR FAN MOTOR

FUSED B+ CIRCUIT

RADIATOR FAN RELAY OUTPUT CIRCUIT

RADIATOR FAN RELAY

TEST	ACTION	APPLICABILITY
1	<p>Turn the ignition on. With the DRBIII®, actuate the Radiator Fan Relay. Using a jumper wire, momentarily jumper the Fuse B+ circuit and Radiator Fan Relay Output circuit in the Radiator Fan Relay harness connector. Is the Radiator Fan actuating?</p> <p>Yes → The Radiator Fan System operating properly at this time. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition off. Disconnect the Radiator Fan harness connector. Measure the Ground circuit in the Radiator Fan harness connector to ground. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 3</p> <p>No → Repair the Ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p>	All
3	<p>Disconnect the Radiator Fan harness connector. Turn the ignition on. With the DRBIII®, actuate the Radiator Fan Relay. Measure the voltage of the Radiator Fan Relay Output circuit in the Radiator Fan harness connector. Is the voltage above 11.0 volts?</p> <p>Yes → Replace the Radiator Fan Motor. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Go To 4</p>	All
4	<p>Turn the ignition off. Remove the Radiator Fan Relay from the PDC. Using a 12-volt test light connected to ground, probe the Fused B+ circuit in the PDC. Does the test light illuminate brightly?</p> <p>Yes → Go To 5</p> <p>No → Repair the Fused B+ circuit. Inspect fuses and replace as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p>	All

*CHECKING RADIATOR FAN RELAY OUTPUT — Continued

TEST	ACTION	APPLICABILITY
5	<p>Turn the ignition off. Remove the Radiator Fan Relay from the PDC. Disconnect the Radiator Fan harness connector. Using a jumper wire, jumper the Fused B+ circuit and the Radiator Fan Output circuit in the Radiator Fan Relay harness connector. Measure the resistance of the Radiator Fan Relay Output circuit between the PDC and the Radiator Fan harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Test Complete.</p> <p>No → Repair the Radiator Fan Relay Output circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p>	All

Symptom:***CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR****POSSIBLE CAUSES**

ECT SENSOR OPERATION

ECT SENSOR

TEST	ACTION	APPLICABILITY
1	<p>NOTE: The engine coolant temperature must be below 62°C (150°F).</p> <p>Turn the ignition on. With the DRBIII®, monitor the ECT value. Start the engine. Does the ECT reach 82°C (180°F) and was it a smooth transition?</p> <p>Yes → Test Complete.</p> <p>No → Replace the Engine Coolant Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p>	All

Symptom:

*CHECKING THE INTAKE AIR TEMPERATURE SENSOR

POSSIBLE CAUSES
IAT SENSOR OPERATION
IAT SENSOR

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Do not allow more than 5 minutes delay during the removal of the IAT sensor and measure the temperature.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, read and record the IAT temperature value.</p> <p>Remove the IAT sensor.</p> <p>Using a temperature probe, measure the temperature inside the opening of the IAT sensor.</p> <p>Compare both temperature readings.</p> <p>Are the temperature readings with 12°C (10°F) of one another?</p> <p>Yes → Test Complete.</p> <p>No → Replace the IAT sensor.</p> <p>Perform POWERTRAIN VERIFICATION TEST VER - 2.</p>	All

Symptom:***CHECKING THE PCM POWER AND GROUNDS****POSSIBLE CAUSES**

PCM FUSED B+ CIRCUIT

PCM FUSED IGNITION SWITCH OUTPUT CIRCUIT

PCM GROUND CIRCUITS

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the PCM harness connector. Using a 12-volt test light connected to ground, probe the PCM Fused B+ circuit in the PCM harness connector. Does the test light illuminate brightly? Yes → Go To 2 No → Repair the Fused B+ circuit. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
2	Turn the ignition off. Disconnect the PCM harness connector. Turn the ignition on. Using a 12-volt test light connected to ground, probe the PCM Fused Ignition Switch Output circuit in the PCM harness connector. Does the test light illuminate brightly? Yes → Go To 3 No → Repair the Ignition Switch Output circuit Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
3	Turn the ignition off. Disconnect the PCM harness connector. Using a 12-volt test light connected to battery voltage, probe the PCM ground circuits in the PCM harness connector. Does the test light illuminate brightly? Yes → Test Complete. No → Repair the PCM ground circuits. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All

Symptom:

*CHECKING THROTTLE POSITION SENSOR OPERATION WITH NO DTC'S

POSSIBLE CAUSES
THROTTLE POSITION SENSOR VOLTAGE ABOVE 1.5 VOLTS
THROTTLE POSITION SENSOR SWEEP
TP SENSOR

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure that the throttle and linkage is not binding and is operating properly.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, read the Throttle Position Sensor voltage.</p> <p>Is the voltage above 1.5 volts?</p> <p>Yes → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p> <p>No → Go To 2</p>	All
2	<p>Turn the ignition on.</p> <p>With the DRBIII®, monitor the Throttle Position Sensor voltage.</p> <p>Slowly open the throttle from the idle position to the wide open throttle position.</p> <p>Does voltage start at approximately 0.8 volts and go above 3.5 volts with a smooth voltage change?</p> <p>Yes → Test Complete.</p> <p>No → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 2.</p>	All

Symptom:**P0645-A/C CLUTCH RELAY CIRCUIT****When Monitored and Set Condition:****P0645-A/C CLUTCH RELAY CIRCUIT**

When Monitored: With the ignition key in the run position and battery voltage above 10.4 volts.

Set Condition: An open or shorted condition is detected in the A/C clutch relay control circuit.

POSSIBLE CAUSES

A/C CLUTCH RLY CIRCUIT WIRING HARNESS OBSERVABLE PROBLEM
 A/C CLUTCH RLY CIRCUIT WIRING HARNESS INTERMITTENT PROBLEM
 FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
 A/C CLUTCH RELAY CONTROL CIRCUIT OPEN
 A/C CLUTCH RELAY CONTROL CIRCUIT SHORT TO GROUND
 A/C CLUTCH RELAY
 PCM (A/C CLUTCH RELAY)

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running With the DRBIII®, actuate the A/C Clutch Relay. Is the A/C Clutch Relay clicking? Yes → Go To 2 No → Go To 4	All
2	Turn the ignition off. Using the schematic as a guide, inspect the Wiring and Connectors. Were any problems found? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 3	All
3	Ignition on, engine not running. With the DRBIII®, actuate the A/C Clutch Relay. Wiggle the Wiring Harness from the Relay to the PCM. Did the wiggling interrupt the clicking? Yes → Repair as necessary where wiggling caused the clicking to be interrupted. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Test Complete.	All

P0645-A/C CLUTCH RELAY CIRCUIT — Continued

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the A/C Clutch harness connector. Note: Check connectors - Clean/repair as necessary. Turn the ignition on. Measure the Fused Ignition Switch Output Circuit voltage at A/C clutch relay. Is the voltage above 10.0 volts? Yes → Go To 5 No → Repair the open Fused Ignition Switch Output Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
5	Turn the Ignition Off. Disconnect the A/C Clutch Relay harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance between Terminals 1(85) and 2 (86) of the A/C Clutch Relay. Is the resistance between 50.0 and 90.0 ohms? Yes → Go To 6 No → Replace the A/C Clutch Relay. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
6	Turn the ignition off. Disconnect the PCM harness connector(s). Remove the A/C Clutch Relay from the PDC. Note: Check connectors - Clean/repair as necessary. Measure the resistance of the A/C Clutch Relay Control Circuit from the Relay harness connector to the PCM harness connector. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair open A/C Clutch Relay Control Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All
7	Turn the Ignition Off. Disconnect the PCM harness connector(s). Disconnect the A/C Clutch Relay harness connector. Note: Check connectors - Clean/repair as necessary. Measure the A/C Clutch Control Circuit resistance at PCM connector to ground. Is the resistance below 5.0 ohms? Yes → Repair the A/C Clutch Relay Control Circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 2. No → Go To 8	All
8	If there are no possible causes remaining, replace the Powertrain Control Module. View repair options. Repair Replace the PCM. Perform POWERTRAIN VERIFICATION TEST VER - 2.	All

Symptom:***CHECKING A/C SYSTEM OPERATION WITH NO DTC'S**

POSSIBLE CAUSES	
A/C CLUTCH RELAY OUTPUT CIRCUIT OPEN	
A/C COMPRESSOR CLUTCH GROUND CIRCUIT OPEN	
FUSED B(+) CIRCUIT OPEN	
A/C CLUTCH COIL	
A/C SELECT CIRCUIT OPEN	
REFRIGERATION SYSTEM NOT PROPERLY CHARGED	
A/C REQUEST CIRCUIT OPEN	
CLUTCH CYCLING SWITCH	
HIGH PRESS CUT-OFF SWITCH	
LOW PRESSURE SWITCH	
A/C CLUTCH RELAY	

TEST	ACTION	APPLICABILITY
1	Ignition on, engine not running. With the DRBIII®, read DTC's. Is there an A/C Clutch Relay DTC? Yes → Go To 2 No → Go To 6	All
2	Turn the ignition off. Disconnect the A/C compressor clutch harness connector. NOTE: Check connectors - Clean/repair as necessary. Measure the resistance of the A/C Compressor Clutch Ground Circuit to ground. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the open A/C compressor clutch ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
3	Ignition on, engine not running. With the DRBIII®, read the A/C Select status. Turn the A/C Switch on and off a few times. Does the A/C Select state change? Yes → Go To 4 No → Repair the open A/C Select Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

***CHECKING A/C SYSTEM OPERATION WITH NO DTC'S — Continued**

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Verify that the Refrigerant System is properly charged per service procedure. Is the Refrigerant System properly charged? Yes → Go To 5 No → Properly charge the Refrigerant System per the service information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
5	Turn the ignition on. Turn the A/C system on and the fan on high. With the DRBIII® in Inputs/Outputs, read the A/C request state. Does the A/C request state change? Yes → Go To 17 No → Go To 17	All
6	Turn the ignition off. Disconnect the A/C compressor clutch harness connector. NOTE: Check connectors - Clean/repair as necessary. Measure the resistance of the A/C Compressor Clutch Ground Circuit to ground. Is the resistance below 5.0 ohms? Yes → Go To 7 No → Repair the open A/C compressor clutch ground circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
7	Ignition on, engine not running. With the DRBIII®, read the A/C Select status. Turn the A/C Switch on and off a few times. Does the A/C Select state change? Yes → Go To 8 No → Repair the open A/C Select Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
8	Turn the ignition off. Verify that the Refrigerant System is properly charged per service procedure. Is the Refrigerant System properly charged? Yes → Go To 9 No → Properly charge the Refrigerant System per the service information. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
9	Turn the ignition on. Turn the A/C system on and the fan on high. With the DRBIII® in Inputs/Outputs, read the A/C request state. Does the A/C request state change? Yes → Go To 10 No → Go To 17	All

***CHECKING A/C SYSTEM OPERATION WITH NO DTC'S — Continued**

TEST	ACTION	APPLICABILITY
10	Turn the ignition off. Verify the Clutch Cycling Switch operation per the service information. Is the Clutch Cycling switch OK? Yes → Go To 11 No → Replace the Clutch Cycling Switch. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
11	Turn the ignition off. Verify the High Pressure Cut-Off Switch per the service information. Is the High Pressure Cut-Off Switch OK? Yes → Go To 12 No → Replace the High Pressure Cut-Off Switch. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
12	Turn the ignition off. Verify the Low Pressure Switch operation per the service information. Is the Low Pressure Switch OK? Yes → Go To 13 No → Replace the Low Pressure Switch. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
13	Turn the ignition off. Disconnect the A/C Clutch harness connector. Remove the A/C Clutch Relay. Note: Check connectors - Clean/repair as necessary. Measure the A/C Clutch Relay Output from the Relay to the A/C Clutch Coil. Is the resistance below 5.0 ohms? Yes → Go To 14 No → Repair the open A/C Clutch Relay Output Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
14	Ignition on, engine not running. With the DRBIII®, actuate the A/C clutch relay. Measure the A/C Clutch Relay Output at the A/C Clutch harness connector. Does the voltage fluctuate between 0.0 and 11.0 volts? Yes → Replace the A/C Clutch Coil. Perform POWERTRAIN VERIFICATION TEST VER - 5. No → Go To 15	All
15	Turn the ignition off. Remove the A/C Clutch Relay. Note: Check connectors - Clean/repair as necessary. Measure the Fused B(+) at the Relay. Is the voltage above 11.0 volts? Yes → Go To 16 No → Repair the open Fused B(+) Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

TEST	ACTION	APPLICABILITY
22	Turn the ignition off. Remove the A/C Clutch Relay. Note: Check connectors - Clean/repair as necessary. Measure the Fused B(+) at the Relay. Is the voltage above 11.0 volts? Yes → Go To 23 No → Repair the open Fused B(+) Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All
23	If there are no possible causes remaining, view repair. Repair Repair the open A/C Request Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 5.	All

Symptom List:

P1595-SPEED CONTROL SOLENOID CIRCUITS

P1683-SPD CTRL PWR RELAY; OR S/C 12V DRIVER CKT

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be **P1595-SPEED CONTROL SOLENOID CIRCUITS**.

When Monitored and Set Condition:

P1595-SPEED CONTROL SOLENOID CIRCUITS

When Monitored: With the ignition key on, the speed control switched on, the SET switch pressed and the vehicle in drive gear moving above 35 MPH.

Set Condition: The powertrain control module actuates the vacuum and vent solenoids but they do not respond.

P1683-SPD CTRL PWR RELAY; OR S/C 12V DRIVER CKT

When Monitored: With the ignition key on and the speed control switched on.

Set Condition: The speed control power supply circuit is either open or shorted to ground.

POSSIBLE CAUSES

S/C POWER SUPPLY CIRCUIT SHORTED TO GROUND
GROUND CIRCUIT AT S/C SERVO CONNECTOR OPEN
S/C WIRING HARNESS INTERMITTENT PROBLEM (S/C VENT SOL AC)
S/C VACUUM SOLENOID CONTROL CIRCUIT OPEN
S/C VACUUM SOLENOID CONTROL CKT SHORT TO GROUND
S/C VENT SOLENOID CONTROL CIRCUIT OPEN
S/C VENT SOLENOID CONTROL CKT SHORT TO GROUND
S/C WIRING HARNESS INTERMITTENT PROBLEM (S/C VAC SOL AC)
S/C WIRING HARNESS OBSERVABLE PROBLEM
S/C SERVO (12V DRIVER CIRCUIT)
S/C SERVO (12V DRIVER CIRCUIT)
S/C POWER SUPPLY CIRCUIT OPEN
BRAKE SWITCH
BRAKE SWITCH OUT OF ADJUSTMENT
S/C BRAKE SWITCH OUTPUT CIRCUIT OPEN
S/C BRAKE SWITCH OUTPUT CIRCUIT SHORTED TO GROUND
PCM (12V DRIVER CIRCUIT)

P1595-SPEED CONTROL SOLENOID CIRCUITS — Continued

TEST	ACTION	APPLICABILITY
1	Ignition On, Engine Not Running. With the DRBIII® actuate the S/C Vent Solenoid. Does the Speed Control Servo click? Yes → Go To 2 No → Go To 24	All
2	Turn the ignition on. With the DRBIII®, actuate the S/C Vacuum Solenoid. Does the Speed Control Servo click? Yes → Go To 3 No → Go To 6	All
3	Turn the ignition off. Using the Schematics as a guide, inspect the Wiring and Connectors. Were any problems found? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 4	All
4	Turn the ignition on. With the DRBIII®, actuate the S/C Vent Solenoid.. Wiggle the Wiring Harness from S/C Servo and Brake Switch to Powertrain Control Module. Did the wiggling interrupt the S/C Servo actuation? Yes → Repair as necessary where wiggling caused the actuation to be interrupted. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 5	All
5	Turn the ignition on. With the DRBIII®, actuate the S/C Vacuum Solenoid. Wiggle the Wiring Harness from S/C Servo and Brake Switch to Powertrain Control Module. Did the wiggling interrupt the S/C actuation? Yes → Repair as necessary where wiggling caused the actuation to be interrupted. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Test Complete.	All
6	Turn the ignition on. With the DRBIII®, actuate the S/C Vent Solenoid.. Wiggle the Wiring Harness from S/C Servo and Brake Switch to Powertrain Control Module. Did the wiggling interrupt the S/C Servo actuation? Yes → Repair as necessary where wiggling caused the actuation to be interrupted. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 7	All

P1595-SPEED CONTROL SOLENOID CIRCUITS — Continued

TEST	ACTION	APPLICABILITY
7	Turn the ignition off. Disconnect the Speed Control Servo harness connector. Note: Check connectors - Clean/repair as necessary. Note: Ensure the Brake Pedal is not depressed during the following steps. Turn the ignition on. Turn S/C Switch on. With the DRBIII®, actuate the S/C Vacuum Solenoid. Using a 12-volt Test Light, check the S/C Brake Switch Output Circuit at the Servo harness connector. Is the light illuminated and bright? Yes → Go To 8 No → Go To 18	All
8	Turn the ignition off. Disconnect the Speed Control Servo harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance of the Ground Circuit at the Servo harness connector to ground. Is the resistance below 5.0 ohms? Yes → Go To 9 No → Repair open Ground Circuit at S/C Servo Connector. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
9	Turn the ignition off. Disconnect the Speed Control Servo 4-way harness connector. Note: Check connectors - Clean/repair as necessary. Note: Ensure the Brake Pedal is not depressed during the following steps. Turn the ignition on. Turn the S/C Switch on. With the DRBIII®, actuate the S/C Vacuum Solenoid. Using a 12-volt Test Light, check the S/C Brake Switch Output Circuit at the Servo harness connector. Is the light illuminated and bright? Yes → Go To 15 No → Go To 10	All
10	Turn ignition off. Using Service Procedure, check Brake Switch adjustment. Was Brake Switch adjustment OK? Yes → Go To 11 No → Adjust Brake Switch. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All

P1595-SPEED CONTROL SOLENOID CIRCUITS — Continued

TEST	ACTION	APPLICABILITY
11	<p>Turn the ignition off. Disconnect the Brake Switch harness connector. Note: Check connectors - Clean/repair as necessary. Be sure the brake pedal is not depressed during the next step. Measure the resistance between the S/C power supply circuit and the S/C brake switch output circuit (measurement taken across switch). Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 12</p> <p>No → Replace the Brake Switch. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p>	All
12	<p>Turn the ignition off. Disconnect the Speed Control Servo harness connector. Disconnect the Brake Lamp Switch harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance between ground and the S/C Brake Switch Output circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair Switched S/C Brake Switch Output circuit shorted to ground. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p> <p>No → Go To 13</p>	All
13	<p>Turn the ignition off. Disconnect the S/C Servo harness connector. Disconnect the Brake Switch harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance of the S/C Brake Switch Output Circuit from the Brake Switch harness Connector to the Servo harness Connector. Is the resistance above 5.0 ohms?</p> <p>Yes → Repair the open S/C Brake Switch Output Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p> <p>No → Go To 14</p>	All
14	<p>Turn the ignition off. Disconnect the Brake Switch harness connector. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance of the S/C Power Supply Circuit from the PCM harness connector to the Brake Switch harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 15</p> <p>No → Repair the open S/C Power Supply Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p>	All

P1595-SPEED CONTROL SOLENOID CIRCUITS — Continued

TEST	ACTION	APPLICABILITY
15	Turn the ignition off. Disconnect the Speed Control Servo harness connector. Disconnect PCM harness connectors. Note: Check connectors - Clean/repair as necessary. Measure the resistance of the S/C Vacuum Solenoid Control Circuit from the PCM harness connector to the Servo harness connector. Is the resistance below 5.0 ohms? Yes → Go To 16 No → Repair the open S/C Vacuum Solenoid Control Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
16	Turn the ignition off. Disconnect the Speed Control Servo harness connector. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance of the S/C Vacuum Solenoid Control Circuit from the Servo harness connector to a good ground. Is the resistance below 5.0 ohms? Yes → Repair the short to ground in the S/C Vacuum Solenoid Control Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 17	All
17	If there are no possible causes remaining, replace the Speed Control Servo. View repair options. Repair Replace the S/C Servo. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
18	Turn ignition off. Using Service Procedure, check Brake Switch adjustment. Was Brake Switch adjustment OK? Yes → Go To 19 No → Adjust Brake Switch. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
19	Turn the ignition off. Disconnect the Brake Switch harness connector. Note: Check connectors - Clean/repair as necessary. Be sure the brake pedal is not depressed during the next step. Measure the resistance between the S/C power supply circuit and the S/C brake switch output circuit (measurement taken across switch). Is the resistance below 5.0 ohms? Yes → Go To 20 No → Replace the Brake Switch. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All

P1595-SPEED CONTROL SOLENOID CIRCUITS — Continued

TEST	ACTION	APPLICABILITY
20	Turn the ignition off. Disconnect the Brake Switch harness connector. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance between the S/C Power Supply Circuit and ground at the Brake Switch harness connector. Is the resistance below 5.0 ohms? Yes → Repair S/C Power Supply Circuit shorted to ground. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 21	All
21	Turn the ignition off. Disconnect the Brake Switch harness connector. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance of the S/C Power Supply Circuit from the PCM harness connector to the Brake Switch harness connector. Is the resistance below 5.0 ohms? Yes → Go To 22 No → Repair the open S/C Power Supply Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
22	Turn the ignition off. Disconnect the Speed Control Servo harness connector. Disconnect the Brake Lamp Switch harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance between ground and the S/C Brake Switch Output circuit. Is the resistance below 5.0 ohms? Yes → Repair Switched S/C Brake Switch Output circuit shorted to ground. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 23	All
23	Turn the ignition off. Disconnect the S/C Servo harness connector. Disconnect the Brake Switch harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance of the S/C Brake Switch Output Circuit from the Brake Switch harness Connector to the Servo harness Connector. Is the resistance above 5.0 ohms? Yes → Repair the open S/C Brake Switch Output Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 35	All

P1595-SPEED CONTROL SOLENOID CIRCUITS — Continued

TEST	ACTION	APPLICABILITY
24	<p>Turn the ignition off. Disconnect the Speed Control Servo 4-way harness connector. Note: Check connectors - Clean/repair as necessary. Note: Ensure the Brake Pedal is not depressed during the following steps. Turn the ignition on. Turn the S/C Switch on. With the DRBIII®, actuate the S/C Vacuum Solenoid. Using a 12-volt Test Light, check the S/C Brake Switch Output Circuit at the Servo harness connector. Is the light illuminated and bright?</p> <p>Yes → Go To 25</p> <p>No → Go To 29</p>	All
25	<p>Turn the ignition off. Disconnect the Speed Control Servo harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance of the Ground Circuit at the Servo harness connector to ground. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 26</p> <p>No → Repair open Ground Circuit at S/C Servo Connector. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p>	All
26	<p>Turn the ignition off. Disconnect the Speed Control Servo harness Connector. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance of the S/C Vent Solenoid Control Circuit from the PCM harness connector to the Servo harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 27</p> <p>No → Repair the open S/C Vent Solenoid Control Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p>	All
27	<p>Turn the ignition off. Disconnect the S/C Servo harness connector. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance of the S/C Vent Solenoid Control Circuit from the Servo harness connector to a good Ground. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the short to ground in the S/C Vent Solenoid Control Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p> <p>No → Go To 28</p>	All

TEST	ACTION	APPLICABILITY
29	Turn ignition off. Using Service Procedure, check Brake Switch adjustment. Was Brake Switch adjustment OK? Yes → Go To 30 No → Adjust Brake Switch. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
30	Turn the ignition off. Disconnect the Brake Switch harness connector. Note: Check connectors - Clean/repair as necessary. Be sure the brake pedal is not depressed during the next step. Measure the resistance between the S/C power supply circuit and the S/C brake switch output circuit (measurement taken across switch). Is the resistance below 5.0 ohms? Yes → Go To 31 No → Replace the Brake Switch. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
31	Turn the ignition off. Disconnect the Brake Switch harness connector. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance of the S/C Power Supply Circuit from the PCM harness connector to the Brake Switch harness connector. Is the resistance below 5.0 ohms? Yes → Go To 32 No → Repair the open S/C Power Supply Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
32	Turn the ignition off. Disconnect the Speed Control Servo harness connector. Disconnect the Brake Lamp Switch harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance between ground and the S/C Brake Switch Output circuit. Is the resistance below 5.0 ohms? Yes → Repair Switched S/C Brake Switch Output circuit shorted to ground. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 33	All
33	Turn the ignition off. Disconnect the S/C Servo harness connector. Disconnect the Brake Switch harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance of the S/C Brake Switch Output Circuit from the Brake Switch harness Connector to the Servo harness Connector. Is the resistance above 5.0 ohms? Yes → Repair the open S/C Brake Switch Output Circuit. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 34	All

P1595-SPEED CONTROL SOLENOID CIRCUITS — Continued

TEST	ACTION	APPLICABILITY
34	Turn the ignition off. Disconnect the Brake Switch harness connector. Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance between the S/C Power Supply Circuit and ground at the Brake Switch harness connector. Is the resistance below 5.0 ohms? Yes → Repair S/C Power Supply Circuit shorted to ground. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 35	All
35	If there are no possible causes remaining, replace the Powertrain Control Module. View repair options. Repair Replace the Powertrain Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All

Symptom:**P1596-SPEED CONTROL SWITCH ALWAYS HIGH****When Monitored and Set Condition:****P1596-SPEED CONTROL SWITCH ALWAYS HIGH**

When Monitored: With the ignition key on.

Set Condition: An open circuit is detected in the speed control on/off switch circuit. The circuit must be above 4.8 volts for more than 2 minutes to set the DTC.

POSSIBLE CAUSES

SPEED CONTROL SWITCH GROUND CIRCUIT OPEN
 SPEED CONTROL SWITCH GROUND CIRCUIT OPEN
 CLOCKSPRING SIGNAL/GROUND CIRCUIT OPEN
 S/C WIRING HARNESS OBSERVABLE PROBLEM
 SPEED CONTROL ON/OFF SWITCH
 SPEED CONTROL SW SIG CKT OPEN
 SPEED CONTROL SW SIG CKT OPEN
 SPEED CONTROL SWITCH SIGNAL CKT SHORTED TO VOLTAGE
 POWERTRAIN CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII® in Inputs/Outputs, read the Speed Control inputs state. While monitoring the DRBIII®, push the Speed Control On/Off Switch several times, then leave it on. Did the DRBIII® show Speed Control Switch off and on? Yes → Go To 2 No → Go To 3	All
2	Turn the ignition off. Using the Schematics as a guide, inspect the Wiring and Connectors. Were any problems found? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Test Complete.	All

P1596-SPEED CONTROL SWITCH ALWAYS HIGH — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off. Disconnect the Speed Control On/Off Switch 2-way harness connector. Disconnect the clockspring 6-way harness connector (S/C switch side) Note: Check connectors - Clean/repair as necessary. Measure the resistance of the S/C Switch Sensor Ground Circuit from the On/Off Switch 2-way harness connector to the clockspring harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 4</p> <p>No → Repair open ground circuit from clockspring to S/C switch. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p>	All
4	<p>Turn the ignition off. Disconnect the clockspring 6-way harness connector (instrument panel harness side). Disconnect the PCM harness connector(s). Note: Check connectors - Clean/repair as necessary. Measure the resistance of the S/C Switch Sensor Ground Circuit from the PCM harness connector to the clockspring harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 5</p> <p>No → Repair open ground circuit from PCM to clockspring. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p>	All
5	<p>Turn the ignition off. Disconnect the Speed Control On/Off Switch 2-way harness connector only. Note: Check connectors - Clean/repair as necessary. Measure the resistance across the S/C On/Off Switch. Is the resistance between 20.3K and 20.7K ohms?</p> <p>Yes → Go To 6</p> <p>No → Replace the On/Off Switch. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p>	All
6	<p>Turn the ignition off. Disconnect the upper and lower 6-way clockspring harness connectors. Note: Check connectors - Clean/repair as necessary. Measure the resistance of the K4 sensor ground circuit between the upper and lower 6-way clockspring harness connectors. Measure the resistance of the V37 speed control switch signal circuit between the upper and lower 6-way clockspring harness connectors. Was the resistance above 5.0 ohms for either circuit?</p> <p>Yes → Replace the clockspring. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p> <p>No → Go To 7</p>	All

P1596-SPEED CONTROL SWITCH ALWAYS HIGH — Continued

TEST	ACTION	APPLICABILITY
7	<p>Turn the ignition off. Disconnect the Speed Control On/Off Switch 2-way harness connector only. Note: Check connectors - Clean/repair as necessary. Turn the ignition on. Measure the S/C Switch Signal Circuit for voltage at the On/Off Switch 2-way connector. Is the voltage above 6.0 volts?</p> <p>Yes → Repair the Speed Control Switch Signal Circuit for a short to voltage. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p> <p>No → Go To 8</p>	All
8	<p>Turn the ignition off. Disconnect the Clockspring 6-way harness connector (instrument panel harness side) . Disconnect the PCM harness connector. Note: Check connectors - Clean/repair as necessary. Using an Ohmmeter, measure the resistance of the S/C Switch Signal Circuit from the PCM to the Clockspring Connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 9</p> <p>No → Repair open Speed Control Switch Signal Circuit PCM to Clockspring. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p>	All
9	<p>Turn the ignition off. Disconnect the On/Off switch 2-way harness connector. Disconnect the upper clockspring harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance of the S/C Switch Signal Circuit from the clockspring harness connector to the On/Off switch harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 10</p> <p>No → Repair the open Speed Control Switch Signal Circuit Clockspring to S/C switch. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p>	All
10	<p>If there are no possible causes remaining, replace the Powertrain Control Module. View repair options.</p> <p>Repair</p> <p>Replace Powertrain Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p>	All

SPEED CONTROL

Symptom:

P1597-SPEED CONTROL SWITCH ALWAYS LOW

When Monitored and Set Condition:

P1597-SPEED CONTROL SWITCH ALWAYS LOW

When Monitored: With the ignition key on and battery voltage above 10.4 volts.

Set Condition: When switch voltage is less than 0.39 volts for 2 minutes.

POSSIBLE CAUSES

CLOCKSPRING SHORTED TO GROUND
S/C WIRING HARNESS OBSERVABLE PROBLEM
S/C SWITCH (ON/OFF)
S/C SWITCH (RESUME/ACCEL)
S/C SIGNAL CIRCUIT SHORTED TO SENSOR GROUND
S/C SWITCH SIGNAL CIRCUIT SHORTED TO GROUND
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read the S/C Switch volts status. Is the S/C Switch voltage below 1.0 volt? Yes → Go To 2 No → Go To 8	All
2	Turn the ignition off. Disconnect the S/C ON/OFF Switch harness connector. Note: Check connectors - Clean/repair as necessary. Turn the ignition on. With the DRBIII® in Sensors, read the S/C Switch volts. Did the S/C Switch volts change to 5.0 volts? Yes → Replace the S/C ON/OFF Switch. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 3	All
3	Turn the ignition off. Disconnect the S/C RESUME/ACCEL Switch harness connector. Note: Check connectors - Clean/repair as necessary. Ignition on, engine not running. With the DRBIII® in Sensors, read the S/C Switch volts. Did the S/C Switch volts go above 4.0 volts? Yes → Replace the Resume/Accel Switch. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 4	All

P1597-SPEED CONTROL SWITCH ALWAYS LOW — Continued

TEST	ACTION	APPLICABILITY
4	<p>Turn the ignition off. Disconnect the clockspring 6-way harness connector (instrument panel wiring side). Turn the ignition on. With the DRBIII® in Sensors, read the S/C Switch volts. Did the S/C Switch volts change to 5.0 volts?</p> <p>Yes → Replace the Clockspring. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p> <p>No → Go To 5</p>	All
5	<p>Turn the ignition off. Disconnect the S/C ON/OFF Switch harness connector. Disconnect the PCM harness connectors. Note: Check connectors - Clean/repair as necessary. Measure the resistance between the S/C Signal Circuit and the Sensor Ground Circuit at the ON/OFF switch harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair S/C Signal Circuit shorted to Sensor Ground. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p> <p>No → Go To 6</p>	All
6	<p>Turn the ignition off. Disconnect the S/C ON/OFF Switch harness connector. Disconnect the PCM harness connectors. Note: Check connectors - Clean/repair as necessary. Measure the resistance between the S/C Switch Signal circuit and ground (B-) at S/C ON/OFF Switch harness connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair S/C Switch Signal Circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p> <p>No → Go To 7</p>	All
7	<p>If there are no possible causes remaining, replace the Powertrain Control Module. View repair options.</p> <p>Repair</p> <p>Replace the Powertrain Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 4.</p>	All

SPEED CONTROL

Symptom:

***BRAKE SWITCH SENSE STATUS DOES NOT CHANGE ON DRB**

POSSIBLE CAUSES

BRAKE LAMP SWITCH GROUND CIRCUIT OPEN
BRAKE LAMP SWITCH SENSE CIRCUIT OPEN
BRAKE LAMP SWITCH SENSE CIRCUIT SHORT TO GROUND
BRAKE SWITCH (SENSE CKT)
POWERTRAIN CONTROL MODULE (BRAKE SENSE)

TEST	ACTION	APPLICABILITY
1	Turn the ignition off. Disconnect the Brake Lamp Switch harness connector. Measure the resistance between ground and the Brake Lamp Switch Ground circuit. Is the resistance below 5.0 ohms? Yes → Go To 2 No → Repair the Brake Lamp Switch Ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
2	Turn the ignition off. Disconnect the Brake Lamp Switch harness connector. Disconnect the PCM harness connectors. Measure the resistance of the Brake Lamp Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Go To 3 No → Repair the Brake Lamp Switch Sense circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
3	Turn the ignition off. Disconnect the Brake Lamp Switch harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance between the Brake Lamp Switch Sense terminal and the Ground terminal (measurement taken across switch). Apply and release the Brake Pedal while monitoring the ohmmeter. Does the resistance change from below 5.0 ohms to open circuit? Yes → Go To 4 No → Replace the Brake Switch. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
4	Turn the ignition off. Disconnect the Brake Lamp Switch harness connector. Disconnect the PCM harness connectors. Disconnect the CAB harness connector. Measure the resistance between ground and the Brake Lamp Switch Sense circuit. Is the resistance below 5.0 ohms? Yes → Repair the Brake Lamp Switch Sense circuit for a short to ground. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 5	All

***BRAKE SWITCH SENSE STATUS DOES NOT CHANGE ON DRB —

5	If there are no possible causes remaining, view repair. Repair Replace the Powertrain Control Module. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All

SPEED CONTROL

Symptom:

***CHECKING SPEED CONTROL OPERATION WITH NO DTC'S PRESENT**

POSSIBLE CAUSES

S/C SW SIGNAL CIRCUIT TO CLOCKS/SPRING CONNECTOR OPEN
GROUND CIRCUIT AT S/C SERVO CONNECTOR OPEN
GROUND CIRCUIT TO S/C RESUME/ACCEL SWITCH CONNECTOR OPEN
DRBIII® DOES NOT SHOW SET SWITCH "PRESSED" OR RELEASED
S/C WIRING HARNESS OBSERVABLE PROBLEM
CANCEL SWITCH
COAST SWITCH
THROTTLE CABLE OBSERVABLE PROBLEM
THROTTLE OPENS AND CLOSES
SPEED CONTROL ON/OFF SWITCH STUCK
SPEED CONTROL RESUME/ACCEL SWITCH
SPEED CONTROL RESUME/ACCEL SWITCH STUCK

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII® in Inputs/Outputs, read the Speed Control Switch state. While observing the display, press the Brake Pedal several times. Does the DRBIII® show Brake Switch "pressed" and "released"? Yes → Go To 2 No → Go To 17	All
2	Turn the ignition on. With the DRBIII® in Inputs/Outputs, read the Speed Control Switch state. While observing the display, press the On/Off Switch several times. Does the DRBIII® show On/Off Switch "pressed" and "released"? Yes → Go To 3 No → Go To 41	All
3	Turn the ignition off. Using the Schematics as a guide, inspect the Wiring and Connectors. Were any problems found? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 4	All

CHECKING SPEED CONTROL OPERATION WITH NO DTC'S PRESENT*— Continued**

TEST	ACTION	APPLICABILITY
4	Turn the ignition off. Disconnect the Speed Control Servo harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance of the Ground Circuit at the Servo harness connector to ground. Is the resistance below 5.0 ohms? Yes → Go To 5 No → Repair open Ground Circuit at S/C Servo Connector. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
5	Turn the ignition on. With the DRBIII® in Inputs/Outputs, read the P/N Switch state. While observing the display, move the Gear Selector to DRIVE. Does the DRBIII® show P/N switch "D/R"? Yes → Go To 6 No → Go To 6	All
6	Turn the ignition off. Inspect the throttle cable and linkage for any binding or damage. Is the cable or linkage disconnected or damaged? Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 4. No → Go To 7	All
7	Turn the ignition on. With the DRBIII® in Inputs/Outputs, read the Speed Control Set Switch state. While observing the display, press the Set Switch several times. Does the DRBIII® show the Set Switch status change appropriately from Pressed to Released? Yes → Go To 8 No → Replace the Left S/C Switch. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All
8	Turn the ignition on. With the DRBIII® in Inputs/Outputs, read the Speed Control Resume Switch state. While observing the display, press the Resume Switch several times. Does the DRBIII® show the Resume Switch status change appropriately from Pressed to Released? Yes → Go To 9 No → Go To 12	All
9	Turn the ignition on. With the DRBIII® in Inputs/Outputs, read the Speed Control Cancel Switch state. While observing the display, press the Cancel Switch several times. Does the DRBIII® show the Cancel Switch status change appropriately from Pressed to Released? Yes → Go To 10 No → Replace the Right S/C Switch. Perform POWERTRAIN VERIFICATION TEST VER - 4.	All

 FUEL PUMP RELAY OUTPUT CIRCUIT OPEN
 FUEL PUMP GROUND CIRCUIT OPEN/HIGH RESISTANCE
 FUEL PUMP MODULE

TEST	ACTION	APPLICABILITY
1	<p>Note: The following list of items must be checked before continuing with any no start tests.</p> <p>The battery must be fully charged and in good condition. A low charged battery may produce invalid test results. If the battery is low, charge the battery and then attempt to start the vehicle by cranking the engine for 15 seconds, 3 consecutive times. This will allow any DTC's to set that may have been erased due to a dead battery. Ensure the Powers and Ground to the PCM are ok.</p> <p>Make sure the PCM communicates with the DRBIII® and that there are no DTC's stored in the PCM memory. If the PCM reports a No Response condition, refer to the Communication category for the proper tests.</p> <p>Read the PCM DTC's with the DRBIII®. If any DTC's are present, they must be repaired before continuing with any other No Start diagnostic tests. Refer to the Symptom list for the related P-code that is reported by the PCM.</p> <p>Ensure that the PCI bus is functional. Attempt to communicate with the Instrument Cluster and SKIM, If you are unable to establish communicate refer to the Communication category for the proper symptoms.</p> <p>The Sentry Key Immobilizer System must be operating properly. Check for proper communication with the DRBIII® and check for DTC's that may be stored in the Sentry Key Immobilizer Module (SKIM). repair the DTC(s) before continuing.</p> <p>If no DTC's are found, using the DRBIII® select Clear PCM (Batt Disconnect).</p> <p>Crank the engine several times. Using the DRB, read DTC's. If a DTC is present perform the DTC diagnostics before continuing.</p> <p>Were any problems found?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Go To 2</p>	All

*ENGINE CRANKS DOES NOT START — Continued

TEST	ACTION	APPLICABILITY
2	<p>Check for any open fuses in the PDC or Fuse Block that may be related to the No Start condition. Are any of the fuses open?</p> <p>Yes → Using the wiring diagram/schematic as a guide, inspect the wiring and connectors, repair as necessary. Replace the Fuse. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Go To 3</p>	All
3	<p>Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test. Note: It may be necessary to use a mechanics stethoscope in the next step. Listen for fuel pump operation at the fuel tank. Does the Fuel Pump operate?</p> <p>Yes → Go To 4</p> <p>No → Go To 9</p> <p>Caution: Stop All Actuations.</p>	All
4	<p>Turn the ignition off. WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Install a fuel pressure gauge to the fuel rail test port. Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge. NOTE: Fuel pressure specification is 339.2 KPa +/- 34 KPa (49.2 psi +/- 5 psi). Choose a conclusion that best matches your fuel pressure reading.</p> <p>Below Specification Go To 5</p> <p>Within Specification Go To 7</p> <p>Above Specification Replace the fuel filter/fuel pressure regulator. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>Caution: Stop All Actuations.</p>	All

***ENGINE CRANKS DOES NOT START — Continued**

TEST	ACTION	APPLICABILITY
5	<p>Turn the ignition off.</p> <p>WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module. Install special 5/16" fuel line adapter tool #6539 between disconnected fuel line and the fuel pump module.</p> <p>Attach a fuel pressure test gauge to the "T" fitting on tool #6539.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge.</p> <p>NOTE: Fuel pressure specification is 339.2 KPa +/- 34 KPa (49.2 psi +/- 5 psi).</p> <p>Is the fuel pressure within specification now?</p> <p>Yes → Repair/replace fuel supply line as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Go To 6</p> <p>Caution: Stop All Actuations.</p>	All
6	<p>Turn the ignition off.</p> <p>WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.</p> <p>Is the Fuel Inlet Strainer plugged?</p> <p>Yes → Replace the Fuel Pump Inlet Strainer. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Replace the Fuel Pump Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
7	<p>Note: The fuel pressure must be within specification before continuing.</p> <p>Turn the ignition off.</p> <p>WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>Disconnect the fuel supply line at the fuel rail.</p> <p>Connect fuel line adapter #6539(5/16") or #6631(3/8") to the disconnected fuel supply line. Insert the other end of the adapter into a graduated container.</p> <p>Caution: Do not operate the fuel pump for more than 7 seconds in the next step. Fuel pump module reservoir may run empty and damage to the fuel pump will result.</p> <p>Note: Specification: A good fuel pump will deliver at least 1/4 liter (1/2 pint) of fuel in 7 seconds.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, actuate the ASD Fuel System test for 7 seconds.</p> <p>Is the fuel pump capacity within specification?</p> <p>Yes → Go To 8</p> <p>No → Check for a kinked/damaged fuel supply line between the fuel tank and fuel rail. If OK, replace the fuel pump module. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>Caution: Stop All Actuations.</p>	All

*ENGINE CRANKS DOES NOT START — Continued

TEST	ACTION	APPLICABILITY
8	<p>The following items need to be checked as a possible cause for a no start condition. Refer to any Technical Service Bulletins that may apply to the symptom.</p> <p>The spark plugs must be free from fuel, oil, coolant and/or any foreign material or deposits.</p> <p>The fuel must be free from contamination.</p> <p>The exhaust may be free from restrictions.</p> <p>The engine compression must be within specifications.</p> <p>The engine valve timing must be within specifications.</p> <p>The engine must be free from vacuum leaks.</p> <p>Were any of the above conditions found?</p> <p>Yes → Test Complete.</p> <p>No → Test Complete.</p>	All

Symptom:

***NO CRANK CONDITION**

POSSIBLE CAUSES
STARTER RELAY OUTPUT CIRCUIT OPEN
BATTERY CIRCUIT RESISTANCE TOO HIGH
STARTER RELAY AUTO
STARTER (AUTO TRANS)
REPAIR MECHANICAL CONDITION
STARTER RELAY GROUND OPEN CIRCUIT
STARTER RELAY MANUAL
FUSED B(+) CIRCUIT OPEN
IGNITION SWITCH OUTPUT CIRCUIT OPEN
PARK/NEUTRAL SWITCH SENSE CIRCUIT OPEN

TEST	ACTION	APPLICABILITY
1	Is the vehicle equipped with a manual transmission? Is the vehicle equipped with a manual transmission? Yes → Go To 2 No → Go To 10	All
2	Turn the ignition off. Remove the starter relay. Using a 12-volt Test Light connected to 12-volts, check the starter ground circuit. Is the test light on? Yes → Go To 3 No → Repair the starter relay ground circuit for an open. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
3	Turn the ignition off. Remove the starter relay. Disconnect the starter relay output wire from the starter solenoid. Connect one end of the starter relay output circuit to ground. Using a 12-volt test light connected to 12-volts, check the other end of the starter relay output circuit. Is the test light on? Yes → Go To 4 No → Repair open Starter Relay Output Ckt. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
4	Turn the ignition off. Check the battery cables for high resistance. (Use service procedure) Did either battery circuit have a voltage drop greater than 0.2 volt? Yes → Repair the Battery Circuit for high resistance. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 5	All

***NO CRANK CONDITION — Continued**

TEST	ACTION	APPLICABILITY
5	Turn the ignition off. Remove the starter relay. Using a 12-volt test light connected to ground, check the fused B(+) circuit. Is the test light on? Yes → Go To 6 No → Repair the Fused B(+) Circuit for an open or high resistance. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
6	Ensure the engine crankshaft is able to rotate and is not seized. Is the engine crankshaft able to rotate? Yes → Go To 7 No → Repair the mechanical condition preventing the starter motor from cranking. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
7	Turn the ignition off. Remove the starter relay. Turn the ignition on. Using a 12-volt test light connected to ground, check the ignition switch output circuit. Note: If equipped with a manual transmission, the clutch pedal must be fully depressed for this test. While observing 12-volt test light, hold ignition key in the start position. Is the test light on? Yes → Go To 8 No → Repair the Ignition Switch Output Circuit for an open or high resistance. Perform POWERTRAIN VERIFICATION TEST VER - 1.	All
8	Turn the ignition off. Remove the starter relay. WARNING: The parking brake must be on and the transmission must be in park for a vehicle equipped with an automatic transmission or in neutral for a vehicle equipped with a manual transmission. WARNING: The engine may be cranked in the next step. Keep away from moving engine parts. Briefly connect a jumper wire between starter relay fused B(+) circuit and starter relay output circuit. Did the starter motor crank the engine? Yes → Replace the starter relay. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 9	All
9	If there are no possible causes remaining, replace the starter motor. View repair options Repair Test Complete.	All

Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Replace the TP Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All

Symptom:***START AND STALL CONDITION**

POSSIBLE CAUSES
CHECKING DTCS
CHECKING SKIM DTCS
FUEL PRESSURE OUT OF SPECS
FUEL PUMP CAPACITY (VOLUME) OUT OF SPECS
THROTTLE POSITION SENSOR SWEEP
TP SENSOR VOLTAGE GREATER THAN 0.92 VOLTS WITH THROTTLE CLOSED
ENGINE COOLANT TEMPERATURE SENSOR OPERATION
OTHER POSSIBLE CAUSES FOR START & STALL
RESTRICTED FUEL SUPPLY LINE
FUEL PUMP INLET STRAINER PLUGGED
FUEL PUMP MODULE

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRBIII®, read DTC's. Are any DTCs present? Yes → Refer to the Driveability Category and perform the appropriate symptom. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 2	All
2	Turn the ignition on. NOTE: If you are unable to communicate with the SKIM, refer to the Communication Category and perform the appropriate symptom. With the DRBIII®, read the SKIM codes. Are there any SKIM DTCs? Yes → Refer to the Vehicle Theft category and perform the appropriate symptom. Perform POWERTRAIN VERIFICATION TEST VER - 1. No → Go To 3	All

*START AND STALL CONDITION — Continued

TEST	ACTION	APPLICABILITY
3	<p>Turn the ignition off.</p> <p>WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>Install a fuel pressure gauge to the fuel rail test port.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge.</p> <p>NOTE: Fuel pressure specification is 339.2 KPa +/- 34 KPa (49.2 psi +/- 5 psi).</p> <p>Choose a conclusion that best matches your fuel pressure reading.</p> <p style="padding-left: 40px;">Below Specification Go To 4</p> <p style="padding-left: 40px;">Within Specification Go To 6</p> <p style="padding-left: 40px;">Above Specification Replace the fuel filter/fuel pressure regulator. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>Caution: Stop All Actuations.</p>	All
4	<p>Turn the ignition off.</p> <p>WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module.</p> <p>Install special 5/16" fuel line adapter tool #6539 between disconnected fuel line and the fuel pump module.</p> <p>Attach a fuel pressure test gauge to the "T" fitting on tool #6539.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, actuate the ASD Fuel System test and observe the fuel pressure gauge.</p> <p>NOTE: Fuel pressure specification is 339.2 KPa +/- 34 KPa (49.2 psi +/- 5 psi).</p> <p>Is the fuel pressure within specification now?</p> <p style="padding-left: 40px;">Yes → Repair/replace fuel supply line as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p style="padding-left: 40px;">No → Go To 5</p> <p>Caution: Stop All Actuations.</p>	All
5	<p>Turn the ignition off.</p> <p>WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.</p> <p>Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.</p> <p>Is the Fuel Inlet Strainer plugged?</p> <p style="padding-left: 40px;">Yes → Replace the Fuel Pump Inlet Strainer. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p style="padding-left: 40px;">No → Test Complete.</p>	All

***START AND STALL CONDITION — Continued**

TEST	ACTION	APPLICABILITY
6	<p>Note: The fuel pressure must be within specification before continuing. Turn the ignition off. WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Disconnect the fuel supply line at the fuel rail. Connect fuel line adapter #6539(5/16") or #6631(3/8") to the disconnected fuel supply line. Insert the other end of the adapter into a graduated container. Caution: Do not operate the fuel pump for more than 7 seconds in the next step. Fuel pump module reservoir may run empty and damage to the fuel pump will result. Note: Specification: A good fuel pump will deliver at least 1/4 liter (1/2 pint) of fuel in 7 seconds. Turn the ignition on. With the DRBIII®, actuate the ASD Fuel System test for 7 seconds. Is the fuel pump capacity within specification?</p> <p>Yes → Go To 7</p> <p>No → Check for a kinked/damaged fuel supply line between the fuel tank and fuel rail. If OK, replace the fuel pump module. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>Caution: Stop All Actuations.</p>	All
7	<p>Turn the ignition on. With the DRBIII®, read TPS VOLTS. While monitoring the DRBIII®, slowly open and close the Throttle. Is the voltage change smooth?</p> <p>Yes → Go To 8</p> <p>No → Replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
8	<p>Turn the ignition on. With the DRBIII®, read Throttle Position voltage. Throttle must be against stop. Is the voltage 0.92 or less with the Throttle closed?</p> <p>Yes → Go To 9</p> <p>No → Check for a binding throttle condition. If OK, replace the Throttle Position Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All

***START AND STALL CONDITION — Continued**

TEST	ACTION	APPLICABILITY
9	<p>Note: For this test to be valid, the thermostat must be operating correctly.</p> <p>Note: This test works best if performed on a cold engine (cold soaked).</p> <p>NOTE: If the vehicle was allow to sit over night with no engine start, coolant temperature should be near ambient temperatures.</p> <p>Turn the ignition on.</p> <p>With the DRBIII®, read the Engine Coolant Temperature value.</p> <p>Note: If engine coolant temperature is above 82° C (180° F), allow the engine to cool until 65° C (150° F) is reached.</p> <p>Start the engine.</p> <p>During engine warm-up, monitor the Engine Coolant Temperature value. The temperature value change should be a smooth transition from start up to normal operating temp 82° C (180° F). The value should reach at least 82° C (180° F).</p> <p>Did the Engine Temperature value increase smoothly and did it reach at least 82° C (180° F)?</p> <p>Yes → Go To 10</p> <p>No → Replace the Engine Coolant Temperature Sensor. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p>	All
10	<p>The following additional items should be checked as a possible cause for a start and stall condition.</p> <p>Refer to any Technical Service Bulletins (TSB's) that may apply to the symptom.</p> <p>Fuel must be free of contamination.</p> <p>The exhaust system must be free of any restrictions.</p> <p>The engine compression must be within specifications.</p> <p>The engine valve timing must be within specifications.</p> <p>The engine must be free from vacuum leaks.</p> <p>The throttle body must be free of carbon buildup and dirt.</p> <p>Do any of the above conditions exist?</p> <p>Yes → Repair as necessary. Perform POWERTRAIN VERIFICATION TEST VER - 1.</p> <p>No → Test Complete.</p>	All

Symptom List:

ANTENNA FAILURE
COP FAILURE
EEPROM FAILURE
INTERNAL FAULT
RAM FAILURE
SERIAL LINK INTERNAL FAULT
STACK OVERFLOW FAILURE

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be ANTENNA FAILURE.

When Monitored and Set Condition:

ANTENNA FAILURE

When Monitored: Every 250 milliseconds with the ignition on.

Set Condition: The SKIM's microcontroller determines that an antenna circuit fault has occurred for 2.0 consecutive seconds.

COP FAILURE

When Monitored: With the ignition on.

Set Condition: The COP timer is not reset by the microcontroller every 65.5 milliseconds

EEPROM FAILURE

When Monitored: With the ignition on.

Set Condition: When the value written to EEPROM memory does not equal the value read back after the write operation.

INTERNAL FAULT

When Monitored: With the ignition on.

Set Condition: The SKIM has detected a fault during an internal self test.

RAM FAILURE

When Monitored: With the ignition on.

Set Condition: The RAM fails a test that checks the RAM's ability to retain memory.

SERIAL LINK INTERNAL FAULT

When Monitored: With the ignition on.

Set Condition: The SKIM fails an internal J1850 communication self test.

STACK OVERFLOW FAILURE

When Monitored: With the ignition on.

Set Condition: The microcontroller has exceeded its stack space limit.

ANTENNA FAILURE — Continued

POSSIBLE CAUSES
SKIM INTERNAL DTC FAILURE

TEST	ACTION	APPLICABILITY
1	<p>Note: This trouble code indicates an internal SKIM fault.</p> <p>With the DRB III, read and record the SKIM DTC's and then erase the SKIM DTC's</p> <p>Perform 10 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.</p> <p>With the DRB III, read the SKIM DTC's.</p> <p>Did the same SKIM DTC return?</p> <p>Yes → Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information.</p> <p>Perform SKIS VERIFICATION.</p> <p>No → Test Complete.</p>	All

Symptom List:**PCM STATUS FAILURE****SERIAL LINK EXTERNAL FAULT**

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be **PCM STATUS FAILURE**.

When Monitored and Set Condition:**PCM STATUS FAILURE**

When Monitored: With the ignition on.

Set Condition: This DTC exists when a PCM STATUS message was not received from the PCM for at least 20.0 consecutive seconds.

SERIAL LINK EXTERNAL FAULT

When Monitored: At ignition on, after ignition on during any rolling code handshake that occurs with the PCM due to a SKIM reset, or during SECRET KEY transfers to the PCM.

Set Condition: When the SKIM does not receive an expected PCI BUS message transmission acknowledgement from the PCM after 3 transmit attempts.

POSSIBLE CAUSES

INTERMITTENT WIRING HARNESS PROBLEM

WIRING HARNESS INSPECTION

SKIM/PCM

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure the PCM has proper power and ground connections before continuing.</p> <p>With the DRB III, read and record the SKIM DTC's then erase the SKIM DTC's. Turn the ignition off. Wait 2 minutes. Turn the ignition on. With the DRB III, read the SKIM DTC's. Does the DRB III display the DTC that was previously erased?</p> <p>Yes → Go To 2 No → Go To 4</p>	All

PCM STATUS FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	<p>Turn the ignition off.</p> <p>NOTE: Visually inspect the related wiring harness and CCD/PCI Bus (whichever applicable) circuits. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Note: Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Were any problems found?</p> <p>Yes → Repair as necessary. Perform SKIS VERIFICATION.</p> <p>No → Go To 3</p>	All
3	<p>NOTE: Before proceeding it will be necessary to obtain the SKIM PIN number.</p> <p>Turn the ignition on.</p> <p>With the DRB III, display and erase all PCM and SKIM DTC's.</p> <p>Perform 5 ignition key cycles leaving the ignition key on for a minimum of 90 seconds per cycle.</p> <p>With the DRB III, read the SKIM DTC's.</p> <p>Does the code appear?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information. Perform SKIS VERIFICATION.</p> <p>No → Test Complete.</p>	All
4	<p>Turn the ignition off.</p> <p>Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Note: Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Were any problems found?</p> <p>Yes → Repair wiring harness/connectors as necessary. Perform SKIS VERIFICATION.</p> <p>No → Test Complete.</p>	All

Symptom List:**ROLLING CODE FAILURE
VIN MISMATCH**

Test Note: All symptoms listed above are diagnosed using the same tests.
The title for the tests will be **ROLLING CODE FAILURE**.

When Monitored and Set Condition:**ROLLING CODE FAILURE**

When Monitored: At ignition on, after ignition on during any rolling code handshake that occurs with the PCM due to a SKIM or PCM reset.

Set Condition: When a PCM STATUS message with a Valid Key status is not received by the SKIM within 3.5 seconds of transmitting the last Valid Key Code message to the PCM.

VIN MISMATCH

When Monitored: With the ignition on.

Set Condition: When the VIN received from the PCM does not match the VIN stored in the SKIM's EEPROM.

POSSIBLE CAUSES

VERIFYING PCM VIN
REPLACE SKIM AND CHECK DTC'S
INTERMITTENT WIRING HARNESS PROBLEM
PCM

TEST	ACTION	APPLICABILITY
1	Turn the ignition on. With the DRB III, erase the SKIM DTC's. Turn the ignition off. Wait 10 seconds. Turn the ignition on and wait 2 minutes. With the DRB III, read the SKIM DTC's. Does the DRB III display the DTC that was previously erased? Yes → Go To 2 No → Go To 4	All

ROLLING CODE FAILURE — Continued

TEST	ACTION	APPLICABILITY
2	<p>NOTE: Ensure that a VIN has been programmed into the PCM. If a VIN is not displayed, attempt to program the PCM with the correct vehicle VIN before continuing.</p> <p>Turn the ignition on.</p> <p>With the DRB III, select Engine system from the main menu.</p> <p>Display and record the Vehicle Identification Number.</p> <p>Does the VIN recorded from the PCM match the VIN of the vehicle?</p> <p>Yes → Go To 3</p> <p>No → Replace and program the Powertrain Control Module in accordance with the Service Information.</p> <p>Perform SKIS VERIFICATION.</p>	All
3	<p>Turn the ignition off.</p> <p>Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information.</p> <p>Turn the ignition on.</p> <p>With the DRB III, display and erase all PCM and SKIM DTC's.</p> <p>Perform 5 ignition key cycles leaving the ignition on for 90 seconds per cycle.</p> <p>With the DRB III, check for SKIM DTC's.</p> <p>Does the DRB III display the same DTC?</p> <p>Yes → Replace and program the Powertrain Control Module in accordance with the Service Information.</p> <p>Perform SKIS VERIFICATION.</p> <p>No → The repair is complete.</p> <p>Perform SKIS VERIFICATION.</p>	All
4	<p>Turn the ignition off.</p> <p>Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.</p> <p>NOTE: Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.</p> <p>Note: Refer to any Technical Service Bulletins (TSB) that may apply.</p> <p>Were any problems found?</p> <p>Yes → Repair wiring harness/connectors as necessary.</p> <p>Perform SKIS VERIFICATION.</p> <p>No → Test Complete.</p>	All

Symptom List:

TRANSPONDER COMMUNICATION FAILURE
TRANSPONDER CYCLIC REDUNDANCY CHECK (CRC) FAILURE
TRANSPONDER ID MISMATCH
TRANSPONDER RESPONSE MISMATCH

Test Note: All symptoms listed above are diagnosed using the same tests. The title for the tests will be TRANSPONDER COMMUNICATION FAILURE.

When Monitored and Set Condition:

TRANSPONDER COMMUNICATION FAILURE

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When the SKIM does not receive a transponder response after 8 consecutive transponder read attempts within 2.0 seconds.

TRANSPONDER CYCLIC REDUNDANCY CHECK (CRC) FAILURE

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When 5 consecutive transponder signal transmissions are sent to the SKIM with the correct message format but with invalid data.

TRANSPONDER ID MISMATCH

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When the transponder ID read by the SKIM does not match any of the transponder ID's stored in the SKIM's memory.

TRANSPONDER RESPONSE MISMATCH

When Monitored: At ignition on and during Key Programming Mode.

Set Condition: When the transponder's crypto algorithm result fails to match the SKIM's result.

POSSIBLE CAUSES

CHECKING MULTIPLE KEY OPERATION
 SKIM
 INTERMITTENT WIRING HARNESS PROBLEM
 REPLACE IGNITION KEY

TRANSPONDER COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
1	<p>With the DRB III, read and record the SKIM DTC's. With the DRB III, erase the SKIM DTC's. NOTE: Perform the following test several times to ensure the DTC is current. Turn the ignition off. Wait 10 seconds. Turn the ignition on. With the DRB III, read the SKIM DTC's. Does the DRB display the DTC that was previously erased?</p> <p>Yes → Go To 2 No → Go To 7</p>	All
2	<p>Are there multiple vehicle ignition keys available?</p> <p>Yes → Go To 3 No → Go To 4</p>	All
3	<p>NOTE: Perform the following steps using one of the vehicle ignition keys. When finished, repeat the procedure using each of the other vehicle keys one at a time. With the DRB III, erase the SKIM DTC's. Turn the ignition off. Wait 10 seconds. Turn the ignition on. With the DRB III, read the SKIM DTC's. Is the DTC present for all ignition keys.</p> <p>Yes → Replace the Sentry Key Immobilizer Module in accordance with the Service Information. Perform SKIS VERIFICATION. No → Test Complete.</p>	All
4	<p>With the DRB III, attempt to reprogram the ignition keys to the SKIM. With the DRB III, erase the SKIM DTC's. Wait 10 seconds. Turn the ignition on. With the DRB III, read the SKIM DTC's. Does the DTC reset?</p> <p>Yes → Go To 5 No → Test Complete.</p>	All
5	<p>Replace the ignition key with a new key. With the DRB III, program the new ignition key to the SKIM. With the DRB III, erase the SKIM DTC's Turn the ignition off. Wait 10 seconds. Turn the ignition on. With the DRB III, read the SKIM DTC's. Does the DTC reset?</p> <p>Yes → Go To 6 No → Test Complete.</p>	All

TRANSPONDER COMMUNICATION FAILURE — Continued

TEST	ACTION	APPLICABILITY
6	If there are no possible causes remaining, view repair. Repair Replace and program the Sentry Key Immobilizer Module in accordance with the Service Information. Perform SKIS VERIFICATION.	All
7	Turn the ignition off. Note: Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires. Note: Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals. Note: Refer to any Technical Service Bulletins (TSB) that may apply. Were any problems found? Yes → Repair wiring harness/connectors as necessary. Perform SKIS VERIFICATION. No → Test Complete.	All

Verification Tests

AW4 TRANS VERIFICATION TEST-VER1	APPLICABILITY
<ol style="list-style-type: none"> 1. Connect the DRBIII® to the Data Link Connector (DLC). 2. Reconnect any disconnected components. 3. With the DRBIII®, erase all Transmission DTC's, also erase the PCM DTC's. 4. Check the transmission fluid and adjust if necessary. Refer to the Service Information for the Fluid Fill procedure. 5. Road test the vehicle. With the DRBIII®, monitor the engine RPM. Make 15 to 20 1-2, 2-3, 3-4 upshifts. Perform these shifts from a standing start to 45 MPH with a constant throttle opening of 20 to 25 degrees. 6. Below 25 MPH, make 5 to 8 wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown. 7. Attempt to reset the specific DTC, drive the vehicle to the When Monitored/When Set conditions for the DTC to verify the DTC is repaired.. 8. Check for Diagnostic Trouble Codes (DTC's) during the road test. If a DTC sets during the road test , return to the Symptom list and perform the diagnostics. 9. NOTE: Erase P0700 DTC in the PCM after making transmission repairs. This will turn the MIL off. <p>Were any DTC's set during the road test?</p> <p style="padding-left: 40px;">Yes refer to the symptom list Repair is not complete, refer to appropriate symptom.</p> <p style="padding-left: 40px;">No Test Complete Repair is complete.</p>	All

FUEL SYSTEM/MISFIRE MONITOR VERIFICATION TEST	APPLICABILITY
<ol style="list-style-type: none"> 1. If any existing DTC's have not been repaired, go to Symptom List and follow path specified. 2. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 3. Connect the DRBIII® to the data link connector. 4. Ensure the fuel tank has at least a quarter tank of fuel. Turn off all accessories. 5. Perform steps 6 through 8 if the PCM has been replaced. Then proceed with the verification. If the PCM has not been replaced skip those steps and continue verification. 6. If PCM has been changed and correct VIN and mileage have not been programmed, a DTC will be set in ABS and Air bag modules. In addition, if vehicle is equipped with a Sentry Key Immobilizer Module (SKIM), Secret Key data must be updated to enable start. 7. For ABS and Air Bag systems: Enter correct VIN and Mileage in PCM. Erase codes in ABS and Air Bag modules. 8. For SKIM theft alarm: Connect DRBIII® to data link conn. Go to Theft Alarm, SKIM, Misc. and place SKIM in secured access mode by using the appropriate PIN code for this vehicle. Select Update the Secret Key data. Data will be transferred from SKIM to PCM. 9. Note: Make sure that Misfire detection is enabled if you repaired a Misfire DTC. Low fuel level or an un-learned Adaptive Numerator can disable the Misfire monitor. 10. Note: If the PCM has been replaced or disconnected during testing, the Adaptive Numerator must be re-learned in order for the Misfire Monitor to run. 11. With the DRB III®, monitor the Similar Conditions to attempt to duplicate the conditions that the vehicle was operating at when the DTC was set. If the conditions can be duplicated, the Good Trip counter will change to one or more. 12. If the conditions cannot be duplicated, with the DRBIII®, erase DTCs. 13. If the repaired DTC has reset, or the OBD II monitor failed after running, the repair is not complete. Check for any technical service bulletins or flash updates and return to Symptom List. 14. If a new DTC has set, return to Symptom List and perform the tests specified for that code. 15. If the monitor ran, and the Good Trip counter changed to one or more, the repair was successful. 16. Erase DTC's. 17. Disconnect the DRBIII®. Test complete. 	All

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 1	APPLICABILITY
<ol style="list-style-type: none"> 1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. Inspect the engine oil for contamination. If it is contaminated, change the oil and filter. 3. Perform the steps 4 through 6 if the PCM has been replaced. Then proceed with the verification. If the PCM has not been replaced skip those steps and continue verification. 4. If PCM has been changed and correct VIN and mileage have not been programmed a DTC will be set in ABS and Air Bag modules. In addition, if vehicle is equipped with a Sentry Key Immobilizer Module (SKIM), Secret Key data must be updated to enable start. 5. For ABS and Air Bag systems: Enter correct VIN and Mileage in PCM. Erase codes in ABS and Air Bag modules. 6. For SKIM theft alarm: Connect DRBIII® to data link conn. Go to Theft Alarm, SKIM, Misc. and place SKIM in secured access mode, by using the appropriate PIN code for this vehicle. Select Update the Secret Key data. Data will be transferred from SKIM to PCM 7. Attempt to start the engine. 8. If the engine is unable to start, look for any Technical Service Bulletins that may relate to this condition. Return to Symptom List if necessary. 9. If the engine starts and stays running, the repair is now complete. 	All

POWERTRAIN VERIFICATION TEST VER - 2	APPLICABILITY
<ol style="list-style-type: none"> 1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. If this verification procedure is being performed after a NO TROUBLE CODE repair, perform steps 3 and 4. 3. Check to see if the initial symptom still exists. If there are DTCs or the symptom no longer exists, the repair was successful and testing is complete. 4. If the initial or another symptom exists, the repair is not complete. Check all technical service bulletins or flash updates and return to Symptoms if necessary. 5. If this verification procedure is being performed after a DTC repair, perform steps 6 through 11. 6. Connect the DRBIII® to the data link connector. With the DRBIII®, erase DTCs and reset all values. 7. If the PCM has been replaced, perform steps 8 through 10, then proceed with the verification. If the PCM has not been replaced, skip those steps and continue verification. 8. If PCM has been replaced and correct VIN and mileage have not been programmed, a DTC will be set in ABS and Air bag modules. In addition, if vehicle is equipped with a Sentry Key Immobilizer System (SKIS), Secret Key data must be updated to enable start. 9. For ABS and Air Bag systems: Enter correct VIN and Mileage in PCM. Erase codes in ABS and Air Bag modules. 10. For SKIS theft alarm: Connect DRBIII® to data link conn. Go to Theft Alarm, SKIM, and Misc. Place SKIM in secured access mode by using the appropriate PIN code for this vehicle. Select Update the Secret Key data. Data will be transferred from SKIM to PCM 11. Road test the vehicle. If the test is for an A/C DTC, ensure it is operating during the following test. Drive the vehicle for at least 5 minutes. 12. Drive the vehicle at least 64 kmh (40 mph). Ensure the trans shifts through all gears. At some point stop the vehicle, turn off the engine for at least 10 seconds. When finished read DTCs with the DRBIII®. If a DTC has set, return to Symptoms and follow path. 13. If the original DTC did not return and there are no new DTCs, the repair was successful and testing is complete. 	All

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 3	APPLICABILITY
<ol style="list-style-type: none"> 1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. Connect the DRBIII® to the Data Link Connector and erase the DTCs. 3. If the PCM has been replaced perform steps 4 through 6 then continue the verification. 4. If PCM has been changed and correct VIN and mileage have not been programmed, a DTC will be set in ABS and Air bag modules. In addition, if vehicle is equipped with a Sentry Key Immobilizer Module (SKIM), Secret Key data must be updated to enable start. 5. For ABS and Air Bag systems: Enter correct VIN and Mileage in PCM. Erase codes in ABS and Air Bag modules. 6. For SKIM theft alarm: Connect DRBIII® to data link conn. Go to Theft Alarm, SKIM, Misc. and place SKIM in secured access mode, by using the appropriate PIN code for this vehicle. Select Update the Secret Key data. Data will be transferred from SKIM to PCM 7. Ensure no other charging system problems remain by doing the following: Start the engine. Perform generator output per service manual. 8. Raise the engine speed to 2000 rpm for at least 30 seconds. 9. Allow the engine to idle. 10. Turn the engine off. 11. Turn the ignition key on. 12. With the DRBIII®, read DTCs. 13. If repaired DTC has reset, or any other one has set, check all pertinent Technical Service Bulletins and return to Symptom List if necessary. 14. If there are DTCs, the repair is now complete. 	All

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 4	APPLICABILITY
<p>1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.</p> <p>2. With the DRBIII®, erase DTCs.</p> <p>3. If the PCM has been replaced, perform steps 4 through 6, then continue with the verification.</p> <p>4. If PCM has been changed and correct VIN and mileage have not been programmed, a DTC will be set in ABS and Air bag modules. In addition, if vehicle is equipped with a Sentry Key Immobilizer Module (SKIM), Secret Key data must be updated to enable start.</p> <p>5. For ABS and Air Bag systems: Enter correct VIN and Mileage in PCM. Erase codes in ABS and Air Bag modules.</p> <p>6. For SKIM theft alarm: Connect DRBIII® to data link conn. Go to Theft Alarm, SKIM, Misc. and place SKIM in secured access mode, by using the appropriate PIN code for this vehicle. Select Update the Secret Key data. Data will be transferred from SKIM to PCM</p> <p>7. Turn the speed control ON (if equipped, cruise light will be on).</p> <p>8. Depress and release the SET Switch. If the speed control did not engage, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>9. Depress and hold the RESUME/ACCEL Switch. If the vehicle speed did not increase by at least 2 mph, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>10. Press and hold the COAST switch. The vehicle speed should decrease. If it did not decrease, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>11. Using caution, depress and release the brake pedal. If the speed control did not disengage, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>12. Bring the vehicle speed back up to 35 MPH.</p> <p>13. Depress the RESUME/ACCEL switch. If the speed control did not resume the previously set speed, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>14. Hold down the SET switch. If the vehicle did not decelerate, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>15. Ensure vehicle speed is greater than 35 mph and release the SET Switch. If vehicle did not adjust and set a new vehicle speed, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>16. Depress and release the CANCEL switch. If the speed control did not disengage, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>17. Bring the vehicle speed back up above 35 mph and engage speed control.</p> <p>18. Depress the OFF switch to turn OFF, (Cruise light will be off). If the speed control did not disengage, the repair is not complete. Check for TSBs that pertain to speed control problem and then, if necessary, return to Symptom List.</p> <p>19. If the vehicle successfully passed all of the previous tests, the speed control system is now functioning as designed. The repair is now complete.</p> <p>20. NOTE: OVERSHOOT/UNDERSHOOT FOLLOWING SPEED CONTROL SET.</p> <p>21. If the vehicle operator repeatedly presses and releases the SET button with their foot off of the accelerator (referred to as "lift foot set"), the vehicle may accelerate and exceed the desired set speed by up to 5 mph (8 km/h).</p> <p>22. It may also decelerate to less than the desired set speed, before finally achieving the desired set speed.</p> <p>23. The Speed Control System has an adaptive strategy that compensates for vehicle-to-vehicle variations in speed control cable lengths.</p> <p>24. When the speed control is set with the vehicles operators foot off of the accelerator pedal, the speed control thinks there is excessive speed control cable slack and adapts accordingly.</p> <p>25. If the "lift foot sets" are continually used, a speed control overshoot/undershoot condition will develop.</p> <p>26. To "unlearn" the overshoot/undershoot condition, the vehicle operator has to press and release the set button while maintaining the desired set speed using the accelerator pedal (not decelerating or accelerating).</p> <p>27. Then turning the cruise control switch to the OFF position (or press the CANCEL button if equipped) after waiting 10 seconds.</p> <p>28. This procedure must be performed approximately 10-15 times to completely unlearn the overshoot/undershoot condition.</p> <p>Did the Speed Control pass the above test?</p> <p>Yes → Repair is complete.</p> <p>No → Repair is not complete, refer to appropriate symptom.</p>	<p>All</p>

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 5	APPLICABILITY
<ol style="list-style-type: none"> 1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. If any existing diagnostic trouble codes have not been repaired, go to Symptom List and follow path specified. 3. Connect the DRBIII® to the data link connector. 4. Ensure the fuel tank has at least a quarter tank of fuel. Turn off all accessories. 5. Perform steps 6 through 8 if the PCM has been replaced. Then proceed with the verification. If the PCM has not been replaced skip those steps and continue verification. 6. If PCM has been changed and correct VIN and mileage have not been programmed, a DTC will be set in ABS and Air bag modules. In addition, if vehicle is equipped with a Sentry Key Immobilizer Module (SKIM), Secret Key data must be updated to enable start. 7. For ABS and Air Bag systems: Enter correct VIN and Mileage in PCM. Erase codes in ABS and Air Bag modules. 8. For SKIM theft alarm: Connect DRBIII® to data link conn. Go to Theft Alarm, SKIM, Misc. and place SKIM in secured access mode by using the appropriate PIN code for this vehicle. Select Update the Secret Key data. Data will be transferred from SKIM to PCM. 9. If a Comprehensive Component DTC was repaired, perform steps 10-13. If a Major OBDII Monitor DTC was repaired skip those steps and continue verification. 10. If the catalytic converter has been replaced, with the DRBIII® in misc. menu option press catalyst replaced. 11. After the ignition has been off for at least 10 seconds, restart the vehicle and run 2 minutes. 12. If the Good Trip counter changed to one or more and there are no new DTC's, the repair was successful and is now complete. Erase DTC's and disconnect the DRBIII®. 13. If the repaired DTC has reset, the repair is not complete. Check for any related TSB's or flash updates and return to the Symptom list. 14. If another DTC has set, return to the Symptom List and follow the path specified for that DTC. 15. With the DRBIII®, monitor the appropriate pre-test enabling conditions until all conditions have been met. Once the conditions have been met, switch screen to the appropriate OBDII monitor, (Audible beeps when the monitor is running). 16. If the monitor ran, and the Good Trip counter changed to one or more, the repair was successful and is now complete. Erase DTC's and disconnect the DRBIII®. 17. If the repaired OBDII trouble code has reset or was seen in the monitor while on the road test, the repair is not complete. Check for any related technical service bulletins or flash updates and return to Symptom List. 18. If another DTC has set, return to the Symptom List and follow the path specified for that DTC. 	All

Verification Tests — Continued

POWERTRAIN VERIFICATION TEST VER - 6	APPLICABILITY
<ol style="list-style-type: none"> 1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. If the PCM was replaced, perform steps 3 through 5 then continue with the verification. Otherwise, skip those steps and continue. 3. If PCM has been changed and correct VIN and mileage have not been programmed, a DTC will be set in ABS and Air bag modules. In addition, if vehicle is equipped with a Sentry Key Immobilizer Module (SKIM), Secret Key data must be updated to enable start. 4. For ABS and Airbag Systems: Enter correct VIN and Mileage in PCM. Erase codes in ABS and Airbag modules. 5. For SKIM theft alarm: Connect DRBIII® to data link conn. Go to Theft Alarm, SKIM, Misc. and place SKIM in secured access mode, by using the appropriate PIN code for this vehicle. Select Update the Secret Key data. Data will be transferred from SKIM to PCM 6. If any existing diagnostic trouble codes are not repaired, go to symptom list and follow path specified. After all diagnostic trouble codes have been repaired, return to TEST VER-6A and run LDP Dealer Test Mode under Systems Test in DRBIII. 7. The LDP Monitor Test Mode has been added to the DRBIII® to verify repairs to the LDP System. A DRBIII® software program was written which causes the PCM to run the LDP Monitor as part of this test. Test failures will be indicated through a stored DTC. 8. LDP Monitor Test Mode is a useful way to run a total system performance test. Use this test to verify any type of LDP system repair. 9. Software program makes temporary changes to operating mode of PCM. For this reason, it is critical that test not be interrupted. PCM's left in this mode as result of interrupted test will illuminate the MIL for 8-10 mi of driving with no DTC's stored. 10. Erasing DTC's will not change this condition. 11. If a vehicle is found to be stuck in the mode described above, the LDP Dealer Test should be re-run in its entirety so that the software program in the DRBIII® can restore the PCM operating mode. 12. Note similarity to LDP Monitor screen found under OBDII Monitors. Failure modes are fewer in this System Test than OBDII LDP Monitor. System Test only stores Small Leak DTC to indicate problem with system. No other type of failure mode indication given. 13. System Test failure may have been, for example, due to a large leak, but the PCM will set the Small Leak DTC to indicate failures that occurred as part of the system test. 14. Connect the DRBIII® to the data link connector. Engine running, turn off all accessories. 15. Note: While test is being performed, PCM must see RPM, minimum MAP, No Vehicle speed and minimum Throttle Position sensor (At idle, in park.) With DRBIII® in System Tests, perform the LDP Monitor Test and follow the instructions on the screen. 16. If the LDP Monitor Test failed and a Small Leak DTC has set, the repair is not complete. Check for any related Technical Service Bulletins and return to Symptom List. 17. If any other trouble code has set, return to Symptom List and follow the path specified for that trouble code. If the LDP Monitor Test passed, the repair was successful and testing is now complete. 	<p>All</p>

Verification Tests — Continued

ROAD TEST VERIFICATION - VER-2	APPLICABILITY
<ol style="list-style-type: none"> 1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary. 2. If this verification procedure is being performed after a non-DTC test, perform steps 3 and 4. 3. Check to see if the initial symptom still exists. If there are no trouble codes and the symptom no longer exists, the repair was successful and testing is now complete. 4. If the initial or another symptom exists, the repair is not complete. Check all pertinent Technical Service Bulletins (TSBs) and return to the Symptom List if necessary. 5. For previously read DTCs that have not been dealt with, return to the Symptom List and follow the diagnostic path for that DTC; otherwise, continue. 6. If the engine control module (ECM) has not been changed, perform steps 7 and 8, otherwise, continue with step 9. 7. With the DRB, erase all diagnostic trouble codes (DTCs), then disconnect the DRB. 8. Turn the ignition off for at least 10 seconds. 9. Ensure no DTCs remain by performing steps 10 through 13. 10. Road test the vehicle. For some of the road test, go at least 64 km/h (40 MPH). If this test is for an A/C Relay Control Circuit, drive the vehicle for at least 5 minutes with the A/C on. 11. At some point, stop the vehicle and turn the engine off for at least 10 seconds, then restart the engine and continue. 12. Upon completion of the road test, turn the engine off and check for DTCs with the DRB. 13. If the repaired DTC has reset, the repair is not complete. Check for any pertinent Technical Service Bulletins (TSBs) and return to the Symptom List. If there are no DTCs, the repair was successful and is now complete. <p>Are any DTCs or symptoms remaining?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All

SKIS VERIFICATION	APPLICABILITY
<ol style="list-style-type: none"> 1. Reconnect all previously disconnected components and connectors. 2. Obtain the vehicle's unique Personal Identification Number (PIN) assigned to it's original SKIM. This number can be obtained from the vehicle's invoice or Chrysler's Customer Center (1-800-992-1997). 3. NOTE: When entering the PIN, care should be taken because the SKIM will only allow 3 consecutive attempts to enter the correct PIN. If 3 consecutive incorrect PIN's are entered the SKIM will Lock Out the DRB III for 1 hour. 4. To exit Lock Out mode, the ignition key must remain in the Run position continually for 1 hour. Turn off all accessories and connect a battery charger if necessary. 5. With the DRB III, select Theft Alarm, SKIM and Miscellaneous. Then select desired procedure and follow the steps that will be displayed. 6. If the SKIM has been replaced, ensure all of the vehicle ignition keys are programmed to the new SKIM. 7. NOTE: Prior to returning vehicle to the costumer, perform a module scan to be sure that all DTC's are erased. Erase any DTC's that are found. 8. With the DRB III erase all DTC's. Perform 5 ignition key cycles leaving the key on for at least 90 seconds per cycle. 9. With the DRB III, read the SKIM DTC's. <p>Are there any SKIM DTC's?</p> <p>Yes → Repair is not complete, refer to appropriate symptom.</p> <p>No → Repair is complete.</p>	All

1.0 INTRODUCTION

The procedures contained in this manual include specifications, instructions, and graphics needed to diagnose the AW4 AUTOMATIC TRANSMISSION. The diagnostics in this manual are based on the failure condition or symptom being present at the time of diagnosis.

Please follow the recommendations below when choosing your diagnostic path.

1. First make sure the DRBIII® is communicating with the appropriate modules; ie., if the DRBIII® displays a "No Response" condition, you must diagnose this first before proceeding.
2. Read DTC's (diagnostic trouble codes) with the DRBIII®.
3. If no DTC's are present, identify the customer complaint.
4. Once the DTC or customer complaint is identified, locate the matching test in the Table of Contents and begin to diagnose the symptom.

All component location views are in Section 8.0. All connector pinouts are in Section 9.0. All system schematics are in section 10.0.

An * placed before the symptom description indicates a customer complaint.

When repairs are required, refer to the appropriate service manual for the proper removal and repair procedure.

Diagnostic procedures change every year. New diagnostic systems may be added; carryover systems may be enhanced. **READ THIS MANUAL BEFORE TRYING TO DIAGNOSE A VEHICLE CODE.** It is recommended that you review the entire manual to become familiar with all new and changed diagnostic procedures.

After using this book, if you have any comments or recommendations, please fill out the form at the back of the book and mail it back to us.

1.1 SIX-STEP TROUBLESHOOTING PROCEDURE

Diagnosis of the AW4 electronic transmission system is done in six basic steps:

- verification of complaint
- verification of any related symptoms
- symptom analysis
- problem isolation
- repair of isolated problem
- verification of proper operation

2.0 IDENTIFICATION OF SYSTEM

All 2001 Jeep Cherokees (XJ) vehicles equipped with a 4.0 liter engine and automatic transmission have an AW4 electronic transmission.

3.0 SYSTEM DESCRIPTION AND FUNCTIONAL OPERATION

3.1 GENERAL DESCRIPTION

The AW4 electronic transmission is a conventional transmission in that it uses hydraulically applied clutches to shift a planetary gear train. However, the electronic control system replaces many of the mechanical and hydraulic components used in conventional transmission valve bodies.

The AW4 transmission control system has improved significantly since it's introduction. The Park/Neutral switch was replaced by a Transmission Range Sensor (TRS). The Transmission Control Module (TCM) now has the ability to communicate with the Powertrain Control Module (PCM) via the CCD Bus. The TCM also has the ability to monitor transmission faults which could affect emissions. Any transmission fault which will adversely affect emissions will set a DTC in the PCM and will also illuminate the MIL.

An Input Speed Sensor (ISS) was added to the control system. This gives improved functional trouble detection. This results in a new Diagnostic Trouble Code (DTC) to detect ISS malfunctions. The "Solenoid A or TCC Solenoid Functional Fault" DTC was separated into two DTC's "Shift solenoid A functional fault" and "TCC solenoid C functional fault" and there was also a new DTC for internal TCM failures.

3.2 FUNCTIONAL OPERATION

The AW4 system performs it's functions based on continuous real-time sensor feedback information. The Transmission Control Module (TCM) continuously checks for electrical problems, some mechanical problems, and some hydraulic problems. When a problem is sensed, the TCM stores a diagnostic trouble code. Some of these codes cause the transmission to go into "limp-in" or "default" mode. While in this mode, the TCM may not energize some of the solenoids in the transmission.

The only transmission functions that may be available are:

- Park and Neutral
- Reverse

GENERAL INFORMATION

- Fourth Gear (Gear Selector OD Position)
- Third Gear (Gear Selector 3 Position)
- First Gear (Gear Selector 1-2 Position)

Depending on the DTC that is set, determines what gear(s) are allowed. If one or more of the transmission solenoids are shorted to voltage or stuck open (therefore appearing energized to the transmission), the transmission may be stuck in the gear that would normally be engaged when a particular solenoid is energized.

The following chart shows the solenoid status required for a particular gear to be engaged.

Sol #A	Sol #B	Gear
Off	On	1st
On	On	2nd
On	Off	3rd
Off	Off	4th

Although vehicle performance may be seriously degraded while in this mode (limp-in), it allows the owner to drive the vehicle in for service.

3.3 DIAGNOSTIC TROUBLE CODES (DTC'S)

Always begin diagnosis by performing a visual inspection,

- check the fluid level and condition and correct as necessary
- check and adjust manual linkage as necessary
- check the electrical connections at the PCM, TCM, TPS, TRS and Transmission solenoids for pushed out or corroded terminals. Make sure all connectors are seated properly.
- test drive the vehicle to verify the customer complaint
- read the DTC's, the DTC will direct you to the specific test(s) in the table of contents that must be performed. If more than one code exists, diagnostic priority should be given to the most recent code.

If there is a CCD bus or communication problem, trouble codes will not be accessible until the problem is repaired. The DRBIII® will display an appropriate diagnostic message.

The following is a possible list of causes for a bus problem:

- open in either or both CCD bus wires.
- short to ground on either or both CCD bus wires.
- short to battery on either or both CCD bus wires.
- internal failure of any module or component on the bus

NOTE: THE CCD BUS SHOULD HAVE APPROXIMATELY 2.5 VOLTS ON BOTH WIRES. FOR MORE DETAILED INFORMATION ABOUT DIAGNOSING CCD BUS PROBLEMS, REFER TO THE APPROPRIATE BODY DIAGNOSTIC SYMPTOM.

The P-code, P1698–No CCD messages from TCM has been added in 1997.

This is a powertrain symptom (PCM code) and is diagnosed in powertrain diagnostics symptoms.

Each diagnostic trouble code is diagnosed by following a testing sequence. The diagnostic test procedures contain step-by-step instructions for determining the cause of a transmission diagnostic trouble code. Possible sources of the code are checked and eliminated one by one. It is not necessary to perform all of the tests in this book to diagnose an individual code. In certain test procedures within this book, codes are used as a diagnostic tool.

DTC's which affect vehicle emissions will illuminate the Malfunction Indicator Lamp (MIL). Three consecutive "Good" OBDII trips or clearing the DTC's with a diagnostic tool (DRBIII® or equivalent) is required to extinguish the MIL.

3.3.1 HARD CODE

Any Diagnostic trouble codes (or **One-Trip** failure or drive cycle) that comes back within one cycle of the ignition key is a "hard" code. This means that the problem is there every time the TCM checks that circuit or function.

NOTE: NOT ALL OBDII CODES WILL NOT SET WITH JUST THE IGNITION KEY ON. THEY MUST BE DRIVEN, IN THE VEHICLE START AND DRIVE CYCLE(S) SUCH THAT ALL DIAGNOSTIC MONITORS HAVE RUN.

3.3.2 INTERMITTENT CODE

A diagnostic trouble code that is not present every time the TCM checks the circuit or function is an "**intermittent**" code. Problems that come and go like this are the most difficult to diagnose, they must be looked for under the specific conditions that cause them.

3.3.3 STARTS SINCE SET COUNTER

For the most recent code (Code 1), the starts since set counter count the number of times the vehicle has started since it was last set. The starts since set counter will count up to 255 starts. When there are no diagnostic trouble codes stored in memory, the DRBIII® will display "NO DTC's DETECTED".

If DTC's are detected, the DRBIII® will display the number of good trips. This is the number of good trips since the latest DTC was set. The number of

good trips helps determine if the diagnostic trouble code is hard or intermittent.

- If the Good Trip count is displayed and equal to 0, the code is a hard code.

Note: Look at “One-Trip” codes as a Hard codes.

- If the code is in the Warm-Up Cycle counter, it is considered an intermittent code. This means that the vehicle (transmission) has been driven at least “3 Good Trips” without the code recurring.

3.3.4 TROUBLE CODE ERASURE

A Diagnostic trouble code will be cleared from TCM memory if 40 Warm-Up Cycles have occurred. A warm-up cycle is defined by CARB as “sufficient vehicle operation such that the coolant temperature has risen by at least 40°F from engine starting and reaches a minimum temperature of 160°F”.

The Malfunction Indicator Lamp (MIL) will turn off after 3 good trips. The MIL will also turn off if the DTC's are cleared from the TCM with the diagnostic scan tool or if the problem corrects itself.

3.3.5 LIST OF DIAGNOSTIC TROUBLE CODES

The TCM may report any of the following DTC's.

Scan	Name of Code
P0122	THROTTLE POSITION SENSOR SIGNAL CIRCUIT
P0562	TRANSMISSION VOLTAGE LOW
P0563	TRANSMISSION VOLTAGE HIGH
P0705	CHECK SHIFTER SIGNAL (RANGE SENSOR)
P0715	INPUT SPEED SENSOR
P0720	OUTPUT SPEED SENSOR
P0740	(TCC) SOLENOID C FUNCTIONAL FAULT
P0751	SOLENOID A FUNCTIONAL FAULT
P0756	SOLENOID B FUNCTIONAL FAULT
P1694	NO CCD MESSAGE FROM PCM
P1718	INTERNAL TCM (EEPROM)
P1742	INTERNAL TCM (ROM)
P1743	INTERNAL TCM (RAM)
P1744	SOLENOID A SHORTED TO GROUND
P1745	SOLENOID A SHORTED TO VOLTAGE OR OPEN
P1746	SOLENOID B SHORTED TO GROUND
P1747	SOLENOID B SHORTED TO VOLTAGE OR OPEN
P1748	(TCC) SOLENOID C SHORTED TO GROUND

P1749 (TCC) SOLENOID C SHORTED TO VOLTAGE OR OPEN

The P-codes, P1698-” No CCD messages from TCM” and P0700 “Transmission Fault Present” are Powertrain Symptoms (PCM codes) and are diagnosed under the powertrain diagnostic symptoms group.

DTC's for AW4 transmission controller are not permanent and will change the moment the reason for the code is corrected.

3.4 INPUT SPEED SENSOR

The TCM uses the Input Speed Sensor (ISS) to detect transmission solenoid functional faults (P0751 solenoid A functional fault, P0756 solenoid B functional fault, TCC solenoid C functional fault). The ISS is a variable reluctance sensor. Changes in the reluctance of a magnetic circuit caused by the passing of the rotor lobes on the overdrive clutch drum result in the ISS outputting an AC periodic voltage wave form. The frequency and voltage of the wave form are proportional to the transmission input speed.

NOTE: SINCE THE OD/CLUTCH DRUM IS STATIONARY IN 4TH GEAR OR WHEN THE VEHICLE IS IN GEAR, BUT NOT MOVING. THERE WILL BE NO ISS SENSOR SIGNAL.

3.5 OUTPUT SPEED SENSOR

The Transmission Control Module (TCM) uses the Output Speed Sensor (OSS) to determine shift points and TCC engagement points. The OSS is a variable reluctance sensor. Changes in the reluctance of a magnetic circuit caused by the passing of the rotor lobes on the output shaft result in the OSS outputting an AC periodic voltage wave form. The frequency and voltage of the wave form are proportional to the transmission output shaft speed.

3.6 TRANSMISSION RANGE SENSOR

The transmission range sensor (TRS) contacts are used to determine the position of the shift lever and also to control the reverse lamps. The TCM determines the shift lever position based on the table below.

Shift lever position	Range Switch states			
	R	D	D3	L
P	off	off	off	off
R	on	off	off	off
N	off	off	off	off
OD	off	on	off	off
3	off	off	on	off
1-2	off	off	off	on

GENERAL INFORMATION

There are five switches in the TRS, 1 each for the 1-2, 3, OD, Reverse and Park/Neutral. The Park/Neutral portion of the TRS is hard wired to the Powertrain Control Module (PCM). The Park/Neutral information is received by the TCM from the PCM over the CCD communication bus. 12 volts is supplied to the TRS through the fused ignition switch output circuit. The TCM senses this voltage when a switch is closed. When the reverse switch is closed, power is supplied to the reverse lamps.

3.7 THROTTLE POSITION SENSOR

The TCM uses the Throttle Position Sensor (TPS) signal to determine shift points. The TPS circuit is hard wired to the TCM. If Pcode **P0122 “Throttle Position Sensor circuit”** is present, there may be a TPS code stored in the PCM. Always repair the PCM throttle position sensor DTC's first.

3.8 TRANSMISSION CONTROL MODULE SYSTEM

3.8.1 COMMUNICATIONS TO PCM

The PCM is continuously sending Bus Messages to the TCM. The TCM requires inputs from the PCM primarily to determine the Vehicle speed, Engine RPM, and the Park/Neutral switch state. The PCM also monitors the CCD bus messages from the TCM. A Diagnostic code is set if the TCM does not receive any valid messages from the PCM for 20 seconds.

3.8.2 OPERATING VOLTAGE

The TCM can operate normally with a battery voltage input between 10.0 and 17.7 volts. If the battery voltage supply (Fused B+) voltage is out of range there is a possibility of abnormal operation and/or TCM failure. A “Transmission Voltage High” or “Transmission Voltage Low” DTC will be set.

NOTE: ALWAYS PERFORM DIAGNOSTICS WITH A FULLY CHARGED BATTERY TO AVOID DIAGNOSING FALSE SYMPTOMS.

3.8.3 SHIFT SOLENOIDS

Two solenoids are used to control shifting. Solenoid A is used to control the 1-2 shift and the 3-4 shift. Solenoid B is used to control the 2-3 shift. Solenoid C controls the operation of the Torque Converter Clutch (TCC). The TCC solenoid is controlled by the TCM. The TCC can be engaged in 2nd, 3rd and fourth gear. The TCC can not be engaged in 1st gear, because it is hydraulically

locked out in 1st gear. If the TCM turns off the solenoids and a voltage is detected on the control circuit a DTC will be set.

3.8.4 FUNCTIONAL FAULTS

Functional faults are detected by the transmission control module. The TCM uses the output speed sensor and the input speed sensor to calculate the current gear ratio. If the gear ratio is not within tolerance (within 10%) for the correct gear detected, a DTC will be set. The TCC solenoid functional fault will set if the difference between engine RPM and transmission input RPM is not consistent with the requested TCC state.

3.9 USING THE DRBIII®

The TCM and other components have the ability to interface over the communications bus. The DRBIII® Scan Tool connects to the Data Link Connector located in the passenger compartment. This allows communication with the TCM.

Refer to the DRBIII® user's guide for instructions and assistance with reading trouble codes, erasing trouble codes, and other DRBIII® functions.

3.9.1 DRBIII® ERROR MESSAGES

Under normal operation, the DRBIII® will display one of only two error messages:

- User-Requested WARM Boot
- User-Requested COLD Boot

If the DRBIII® should display any other error message, record the entire display and call the MDS Hotline. This is a **Sample** of such an error message display:

```
ver: 2.14
date: 26 Jul93
file: key_itf.cc
date: Jul 26 1998
line: 548
err: 0x1
User-Requested COLD Boot
```

Press MORE to switch between this display and the application screen.
Press F4 when done noting information.

3.9.2 DRBIII® DOES NOT POWER UP (BLANK SCREEN)

If the LED's do not light or no sound is emitted at start up, check for loose cable connections or a bad cable. Check the vehicle battery voltage. A minimum of 11 volts is required to adequately power the DRBIII®.

If all connections are proper between the DRBIII® and the vehicle or other devices, and the

vehicle battery is fully charged, an inoperative DRBIII® may be the result of a faulty cable or vehicle wiring. For a blank screen, refer to the XJ Body Diagnostic symptoms.

3.9.3 DISPLAY IS NOT VISIBLE

Low temperatures will affect the visibility of the display. Adjust the contrast to compensate for this condition.

4.0 DISCLAIMERS, SAFETY, WARNINGS

4.1 DISCLAIMERS

All information, illustrations and specifications contained in this manual are based on the latest information at the time of publication. The right is reserved to make changes at any time without notice.

4.2 SAFETY

4.2.1 TECHNICIAN SAFETY INFORMATION

WARNING: ENGINES PRODUCE CARBON MONOXIDE THAT IS ODORLESS, CAUSES SLOWER REACTION TIMES AND CAN LEAD TO SERIOUS INJURY. WHEN THE ENGINE IS OPERATING, KEEP SERVICE AREAS WELL VENTILATED OR ATTACH THE VEHICLE EXHAUST SYSTEM TO THE SHOP EXHAUST REMOVAL SYSTEM.

Some operations in this manual require that hydraulic tubes, hoses, and fittings, to be disconnected for inspection or testing purposes. These systems, when fully charged, contains fluid at high

pressure. Before disconnecting any hydraulic tubes, hoses or fittings, be sure that the system is fully de-pressurized.

When servicing a vehicle, always wear eye protection and remove any metal jewelry such as watchbands or bracelets that might make an inadvertent electrical contact.

When diagnosing a transmission system problem, it is important to follow approved procedures where applicable. Following these procedures is very important to the safety of individuals performing diagnostic tests.

4.2.2 VEHICLE PREPARATION FOR TESTING

Make sure the vehicle being tested has a fully charged battery. If it does not, false diagnostic codes or error messages may occur. It is extremely important that accurate shift lever position data be available to the TCM. The accuracy of any diagnostic trouble code found in memory is doubtful unless the Shift Lever Test, performed on the DRBIII® Scan Tool, passes without fail.

4.2.3 SERVICING SUB-ASSEMBLIES

Some components of the powertrain system are intended to be serviced in assembly only. Attempting to remove or repair certain system sub-components may result in personal injury and/or improper system operation. Only those components with approved repair and installation procedures in the service manual should be serviced.

4.2.4 DRBIII® SAFETY INFORMATION

WARNING: EXCEEDING THE LIMITS OF THE DRB® MULTIMETER IS DANGEROUS. IT CAN EXPOSE YOU TO SERIOUS OR POSSIBLY FATAL INJURY. CAREFULLY READ AND UNDERSTAND THE CAUTIONS AND THE SPECIFICATION LIMITS.

- Follow the vehicle manufacture's service specifications at all times.
- Do not use the DRB® if it has been damaged.
- Do not use the test leads if the insulation is damaged or if metal is exposed.
- To avoid electrical shock, do not touch the test leads, tips, or the circuit being tested.
- Choose the proper range and function for the measurement. Do not try voltage or current measurements that may exceed the rated capacity.
- Do not exceed the limits shown in the table.

GENERAL INFORMATION

FUNCTION	INPUT LIMIT
Volts	0 - 500 peak volts AC 0 - 500 volts DC
Ohms (resistance)*	0 -1.12 megohms
Frequency Measured Frequency Generated	0 - 10 kHz
Temperature	-58 - 1100°F -50 - 600°C

* Ohms cannot be measured if voltage is present. Ohms can be measured only in a non-powered circuit.

- Voltage between any terminal and ground must not exceed 500v DC or 500v peak AC.
- Use caution when measuring voltage above 25v DC or 25v AC.
- The circuit being tested must be protected by a 10A. fuse or circuit breaker.
- Use the low current shunt to measure circuits up to 10A. Use the high current clamp to measure circuits exceeding 10A.
- When testing for the presence of voltage or current, make sure the meter is functioning correctly. Take a reading of a known voltage or current before accepting a zero reading.
- When measuring current, connect the meter in series with the load.
- Disconnect the live test lead before disconnecting the common test lead.
- When using the meter function, keep the DRBIII® away from spark plug or coil wires to avoid measuring error from outside interference.

4.3 WARNINGS

4.3.1 VEHICLE DAMAGE WARNINGS

Before disconnecting any control module, make sure the ignition is "off". Failure to do so could damage the module.

When testing voltage or continuity at any control module, use the terminal side (not the wire end) of the connector. Do not probe a wire through the insulation; this will damage it and eventually cause it to fail because of corrosion.

Be careful when performing electrical tests so as to prevent accidental shorting of terminals. Such mistakes can damage fuses or components. Also, a second code could be set, making diagnosis of the original problem more difficult.

4.3.2 ROAD TEST COMPLAINT VEHICLE

Some complaints will require a test drive as part of the repair verification procedure. The purpose of the test drive is to try to duplicate the diagnostic code or symptom.

CAUTION: BEFORE ROAD TESTING A VEHICLE, BE SURE THAT ALL COMPONENTS ARE REASSEMBLED. DURING THE TEST DRIVE, DO NOT TRY TO READ THE DRBIII® SCREEN WHILE IN MOTION. DO NOT HANG THE DRBIII® FROM THE REAR VIEW MIRROR OR OPERATE IT YOURSELF. HAVE AN ASSISTANT AVAILABLE TO OPERATE THE DRBIII®.

Road testing is an essential step in the diagnostic process that must not be overlooked. Along with diagnostic information obtained from the DRBIII® Scan Tool and the original customer concern, the road test helps to verify the problem and observe operation under actual vehicle driving conditions.

Just as important as the road test is, there are preliminary inspections that should be carried out prior to the road test. Always check the fluid level and condition before going on a road test or performing other tests. Also try to determine the type of fluid being used. Improper fluid can result in problems. Additionally, a variety of complaints can be caused by incorrect fluid level. Some of the conditions caused by incorrect fluid level are as follows:

- Delayed engagement
- Poor shifting or erratic shifts
- Excessive noise
- Overheating

The next step is to verify that the shift linkage is correctly adjusted. If the gearshift linkage is incorrectly adjusted because of wear or incorrect adjustment, a number of complaints can result.

The TCM monitors the Transmission Range (TRS) Sensor at all times. If the linkage is incorrectly adjusted, the TCM may sense a shift lever position that is not correct for the gear range chosen by the driver. This may cause diagnostic trouble codes to be set and a possible limp-in situation.

The following complaints may also be the result of an incorrectly adjusted or worn linkage:

- Delayed clutch engagement or erratic shifts
- Vehicle able to drive in Neutral
- Engine not able to crank in Park or Neutral
- Gearshift linkage able to be shifted without the key in the ignition
- Not able to remove the ignition key in Reverse
- Parking pawl not engaging

The shift linkage should also be adjusted when replacing the transmission, repairing the valve body or repairing any component between the shift lever and the transmission.

Some questions to ask yourself when considering the road test are listed below:

- Is the complaint or concern what you think it is, based on the driver's description of the problem?
- Is the transmission operating normally, or is there a real problem?
- When does the malfunction occur?
- Is the problem in only one gear range?
- What temperature does the complaint occur?
- Is the transmission in limp-in mode?

4.3.3 BULLETINS AND RECALLS

The service procedures contained in this manual are correct, provided that all applicable Safety Recalls and Technical Service Bulletins have been performed. Perform a Dial Function 70 to retrieve a recall history for the vehicle being serviced.

5.0 REQUIRED TOOLS AND EQUIPMENT

- > DRBIII® (diagnostic read-out box) - DRBIII® must use the most current software release level.
- > Jumper wires
- > Ohmmeter
- > Voltmeter

6.0 GLOSSARY OF TERMS

6.1 ACRONYMS

BCM	Body Control Module
CARB	California Air Resource Board
CCD	Chrysler Collision Detection (communication bus)
CKT	Circuit
DLC	Data Link Connector
CVI	Clutch Volume Index
DLC	Data Link Connector
DRBIII®	Diagnostic Readout Box
DTC	Diagnostic Trouble Code
IOD	Ignition off-draw
ISS	Input Speed Sensor
LED	Light Emitting Diode

L-R	Low/reverse Clutch
LU	Lockup
MIL	Malfunction Indicator Lamp
OD	Overdrive
OSS	Output Speed Sensor
PCM	Powertrain Control Module
REV	Reverse
SW	Switch
TCC	Torque Converter Clutch
TCM	Transmission Control Module
TPS	Throttle Position Sensor
TRS	Transmission Range Sensor
UD	Underdrive
VSS	Vehicle Speed Sensor

6.2 DEFINITIONS

OBDII Trip - A vehicle start and drive cycle such that all once per trip diagnostic monitors have run.

Key Start - A vehicle start and run cycle of at least 20 seconds.

Warm-up Cycle - A vehicle start and run cycle such that the engine coolant must rise to at least 160°F and must rise by at least 40°F from initial start up. To count as a warm-up cycle, no faults may occur during the cycle.

NOTES

7.0

DIAGNOSTIC INFORMATION AND PROCEDURES

Symptom:

***NO RESPONSE FROM TRANSMISSION CONTROL MODULE**

POSSIBLE CAUSES
GROUND CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
CCD BUS (+) CIRCUIT OPEN
CCD BUS (-) CIRCUIT OPEN
TRANSMISSION CONTROL MODULE

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Ensure the DRB can establish communications with the PCM before beginning.</p> <p>Turn the ignition off. Disconnect the TCM harness connector. Measure the resistance between ground and the ground circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 2</p> <p>No → Repair the Ground circuit for an open. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All

TCM-TPS CIRCUIT

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Always perform diagnostics with a fully charged battery to avoid diagnosing false symptoms.</p> <p>NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.</p> <p>Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary.</p> <p>Verify the brake switch input to the TCM is working correctly.</p> <p>Perform the shift lever position test and adjust the linkage if necessary.</p> <p>Test drive vehicle to verify customer complaint.</p> <p>With the DRBIII®, read the PCM DTC's. Check and repair all PCM DTC's before performing transmission diagnostics.</p> <p>With the DRBIII®, read the TCM DTC's.</p> <p>Note: Check 1 trip failures and diagnose them as DTC's (Hard codes)</p> <p>Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run.</p> <p>Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.</p> <p>NOTE: Check for applicable TSB's related to the problem.</p> <p>Perform this procedure prior to symptom diagnosis.</p> <p>Continue Go To 2</p>	All

P0122-THROTTLE POSITION SENSOR — Continued

TEST	ACTION	APPLICABILITY
2	<p>When monitored: Continuously with the ignition key on. When set: The Throttle Position Sensor Signal circuit is out of range for 7 seconds or the Sensor Ground circuit is open or shorted to voltage for 7 seconds. This is the When monitored / When set conditions for DTC P0122.</p> <p>Continue Go To 3</p>	All
3	<p>With the DRBIII®, read PCM DTC's. Are there any TPS related DTC's stored in the PCM?</p> <p>Yes → Repair all Powertrain TPS codes before performing the Transmission diagnostics. Perform AW4 TRANS VERIFICATION TEST-VER1.</p> <p>No → Go To 4</p>	All
4	<p>Start the engine. Allow the engine to idle. With the DRBIII®, Check the Throttle Position Sensor Voltage under Transmission sensors. Is the Throttle Position Sensor voltage below 0.3 or above 1.0 volts?</p> <p>Yes → Go To 5 No → Go To 11</p>	All
5	<p>Ignition Off. Disconnect the Throttle Position Sensor (TPS). Disconnect the Transmission Control Module (TCM). Note: Check connectors - Clean/repair as necessary. Measure the resistance of the TPS Signal Circuit from the TCM connector to the TPS Connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 6 No → Repair the open TPS Signal circuit. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All
6	<p>Ignition Off. Disconnect the TPS harness connector. Disconnect the TCM harness connector. Note: Check connectors - Clean/repair as necessary. Measure the resistance of the Sensor Ground Circuit between the TPS connector and the Transmission Control Module connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Go To 7 No → Repair the open TPS Sensor Ground circuit. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All

P0122-THROTTLE POSITION SENSOR — Continued

TEST	ACTION	APPLICABILITY
7	<p>Turn the ignition off. Disconnect the Throttle Position Sensor harness connector. Disconnect the Transmission Control Module harness connector. Note: Check connectors - Clean/repair as necessary. With an Ohmmeter, measure the TP Sensor Signal Circuit to ground at the TCM connector. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the TPS Signal circuit for a short to ground. Perform AW4 TRANS VERIFICATION TEST-VER1.</p> <p>No → Go To 8</p>	All
8	<p>Turn the ignition off. Disconnect the Throttle Position Sensor harness connector. Note: Check connectors - Clean/repair as necessary. Turn the ignition on. With a Voltmeter, measure the TPS Sensor Ground Circuit. Is the voltage above 0.2 volts?</p> <p>Yes → Repair the TPS Sensor Ground circuit short to voltage. Perform AW4 TRANS VERIFICATION TEST-VER1.</p> <p>No → Go To 9</p>	All
9	<p>Turn the ignition off. Disconnect the Throttle Position Sensor harness connector. Note: Check connectors - Clean/repair as necessary. Turn the ignition on. With a Voltmeter, measure the Throttle Position Sensor Signal Circuit. Is the voltage above 5.0 volts?</p> <p>Yes → Repair the TPS Signal circuit for a short to voltage. Perform AW4 TRANS VERIFICATION TEST-VER1.</p> <p>No → Go To 10</p>	All
10	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the TCM. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All
11	<p>Using the when monitored / when set conditions, attempt to reset the DTC. If the DTC can be reset return to the symptom list and perform the appropriate diagnostic test. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. NOTE: Check the Technical Service Bulletins. Were any problems found?</p> <p>Yes → Repair the wiring and/or connectors as necessary. Perform AW4 TRANS VERIFICATION TEST-VER1.</p> <p>No → Test Complete.</p>	All

Symptom:**P0562-TRANSMISSION VOLTAGE LOW****When Monitored and Set Condition:****P0562-TRANSMISSION VOLTAGE LOW**

When Monitored: Continuously with the key on.

Set Condition: The voltage on the Fused B(+) circuit falls below 10.0 volts for 1 minute.

POSSIBLE CAUSES

CHARGING SYSTEM DTC'S PRESENT IN THE PCM
 INTERMITTENT WIRING AND/OR CONNECTORS
 TCM FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE
 TCM GROUND CIRCUIT HAS OPEN OR HIGH RESISTANCE
 TCM-FUSED B+ SUPPLY

TEST	ACTION	APPLICABILITY

Symptom:**P1745 SOLENOID A SHORTED TO VOLTAGE OR OPEN****When Monitored and Set Condition:****P1745 SOLENOID A SHORTED TO VOLTAGE OR OPEN**

When Monitored: Continuously while in 1st and 4th gear.

Set Condition: When Solenoid A is turned off and voltage is detected on the Solenoid A Control circuit.

POSSIBLE CAUSES

INTERMITTENT WIRING AND/OR CONNECTORS

OPEN BETWEEN THE 8-WAY CONNECTOR AND TCM CONNECTOR

SHORT TO VOLTAGE BETWEEN THE 8-WAY CONNECTOR AND THE TCM CONNECTOR

OPEN BETWEEN THE 8-WAY CONNECTOR AND SOLENOID A CONNECTOR

OPEN OR HIGH RESISTANCE TRANSMISSION CASE GROUND

SHORT TO VOLTAGE BETWEEN THE 8-WAY CONNECTOR AND THE SOLENOID A CONNECTOR

SOLENOID A - RESISTANCE OUT OF RANGE

TCM - SOLENOID A CONTROL CIRCUIT

TEST	ACTION	APPLICABILITY
1	<p>NOTE: Always perform diagnostics with a fully charged battery to avoid diagnosing false symptoms.</p> <p>NOTE: Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the service information.</p> <p>Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary.</p> <p>Verify the brake switch input to the TCM is working correctly.</p> <p>Perform the shift lever position test and adjust the linkage if necessary.</p> <p>Test drive vehicle to verify customer complaint.</p> <p>With the DRBIII®, read the PCM DTC's. Check and repair all PCM DTC's before performing transmission diagnostics.</p> <p>With the DRBIII®, read the TCM DTC's.</p> <p>Note: Check 1 trip failures and diagnose them as DTC's (Hard codes)</p> <p>Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run.</p> <p>Note: Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller.</p> <p>NOTE: Check for applicable TSB's related to the problem.</p> <p>Perform this procedure prior to symptom diagnosis.</p> <p>Continue</p> <p>Go To 2</p>	All

P1745 SOLENOID A SHORTED TO VOLTAGE OR OPEN — Continued

TEST	ACTION	APPLICABILITY
2	<p>When monitored: Continuously while in 1st and 4th gear. When set: When Solenoid A is turned off and voltage is detected on the Solenoid A Control circuit. This is the When monitored / When set conditions for DTC P1745.</p> <p>Continue Go To 3</p>	All
3	<p>With the DRBIII®, erase DTC's. NOTE: The vehicle must be driven on the road for the next step. Place the gear selector in the D range. Accelerate the vehicle to 40 MPH and hold for 30 seconds. Did the DTC P1745 reset?</p> <p>Yes → Go To 4 No → Go To 11</p>	All
4	<p>Turn ignition off to the lock position. Disconnect the TCM harness connector. Disconnect the 8-way harness connector. NOTE: Check connectors - Clean/repair as necessary. Measure the resistance of the Solenoid A Control circuit between the 8-WAY connector and the TCM connector. Is the resistance above 5.0 ohms?</p> <p>Yes → Repair the open Solenoid A Control circuit. Perform AW4 TRANS VERIFICATION TEST-VER1. No → Go To 5</p>	All
5	<p>Turn ignition off to the lock position. Disconnect the Transmission Solenoid 8-Way harness connector. NOTE: Check connectors - Clean/repair as necessary. Turn the ignition on. Measure the voltage of the Solenoid A Control circuit in the 8-way connector. Is there any voltage present?</p> <p>Yes → Repair the Solenoid A Control circuit for a short to voltage. Perform AW4 TRANS VERIFICATION TEST-VER1. No → Go To 6</p>	All
6	<p>Turn ignition off to the lock position. Disconnect the Transmission Solenoid 8-way harness connector. Remove the Transmission Pan, per the Service Information. Disconnect the Solenoid A harness connector. NOTE: Check connectors - Clean/repair as necessary. Measure the resistance of the Solenoid A Control circuit between the 8-WAY connector and the Solenoid A connector. Is the resistance above 5.0 ohms?</p> <p>Yes → Repair the open Solenoid A Control circuit. Perform AW4 TRANS VERIFICATION TEST-VER1. No → Go To 7</p>	All

P1745 SOLENOID A SHORTED TO VOLTAGE OR OPEN — Continued

TEST	ACTION	APPLICABILITY
7	<p>With the DRBIII®, read TCM DTC's. Are DTC's P1747 and P1749 present in addition to the P1745 DTC?</p> <p>Yes → Repair the open or high resistance Transmission Case Ground. Perform AW4 TRANS VERIFICATION TEST-VER1.</p> <p>No → Go To 8</p>	All
8	<p>Turn ignition off to the lock position. Remove the Transmission Oil Pan, refer to the Service Information. Disconnect the Solenoid A harness connector. NOTE: Check connectors - Clean/repair as necessary. Turn the ignition on. Measure the voltage of the Solenoid A Control circuit in the Solenoid A connector. Is there any voltage present?</p> <p>Yes → Repair the Solenoid A Control circuit for a short to voltage. Perform AW4 TRANS VERIFICATION TEST-VER1.</p> <p>No → Go To 9</p>	All
9	<p>Turn ignition off to the lock position. Remove the Transmission Oil Pan, refer to the service information. Disconnect the Solenoid A harness connector. NOTE: Check connectors - Clean/repair as necessary. Measure the resistance of Solenoid A from the solenoid mounting bracket to the solenoid wire terminal. Is the resistance between 11.0 and 15.0 ohms?</p> <p>Yes → Go To 10</p> <p>No → Replace Solenoid A. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All
10	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the TCM. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All

Is there any voltage present?</p> <p>Yes → Repair the Solenoid C Control circuit for a short to voltage. Perform AW4 TRANS VERIFICATION TEST-VER1.</p> <p>No → Go To 9</p>	All
9	<p>Turn ignition off to the lock position. Remove the Transmission Oil Pan, refer to the service information. Disconnect the Solenoid C harness connector. NOTE: Check connectors - Clean/repair as necessary. Measure the resistance of Solenoid C from the solenoid mounting bracket to the solenoid wire terminal. Is the resistance between 11.0 and 15.0 ohms?</p> <p>Yes → Go To 10</p> <p>No → Replace Solenoid C. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All
10	<p>If there are no possible causes remaining, view repair.</p> <p>Repair Replace the TCM. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All
11	<p>Using the when monitored / when set conditions, attempt to reset the DTC. If the DTC can be reset return to the symptom list and perform the appropriate diagnostic test. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. NOTE: Check the Technical Service Bulletins. Were any problems found?</p> <p>Yes → Repair the wiring and/or connectors as necessary. Perform AW4 TRANS VERIFICATION TEST-VER1.</p> <p>No → Test Complete.</p>	All

TRANSMISSION

Symptom:

* **ENGINE STALLS WITH TRANSMISSION IN GEAR**

POSSIBLE CAUSES
*ENGINE STALLS WITH TRANS IN GEAR

TEST	ACTION	APPLICABILITY
1	<p>This is just one possible cause of the engine stalling while in gear. NOTE: With the DRBIII®, check and repair any PCM DTC's first. If no PCM DTC's are present, check the TCC circuit for proper operation.</p> <p>Yes → Check for Transmission Torque Converter Clutch DTC's and proper Torque Converter Clutch operation. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All

Symptom:***NO BRAKE SWITCH INPUT TO TCM****POSSIBLE CAUSES**

BRAKE SWITCH GROUND CIRCUIT OPEN

BRAKE SWITCH SENSE CKT OPEN

BRAKE SWITCH SENSE CIRCUIT SHORTED TO GROUND

BRAKE SWITCH

TCM - BRAKE SWITCH

TEST	ACTION	APPLICABILITY
1	<p>With the DRBIII® in Inputs/Outputs, read the Brake Switch state. Press the Brake Pedal while monitoring the Brake Switch status. Does the Brake Switch status switch from OFF to ON?</p> <p>Yes → Test Complete.</p> <p>No → Go To 2</p>	All
2	<p>Turn ignition off to the lock position. Disconnect the Brake Switch harness connector.</p> <p>NOTE: Check connectors - Clean/repair as necessary.</p> <p>Measure the resistance between ground and the Ground circuit. Is the resistance above 5.0 ohms?</p> <p>Yes → Repair the open Brake Switch ground. Perform AW4 TRANS VERIFICATION TEST-VER1.</p> <p>No → Go To 3</p>	All
3	<p>Turn ignition off to the lock position. Disconnect the Brake Switch harness connector. Disconnect the TCM harness connector.</p> <p>NOTE: Check connectors - Clean/repair as necessary.</p> <p>Measure the resistance of the Brake Switch Sense circuit between the TCM harness connector and the Brake Switch harness connector. Is the resistance above 5.0 ohms?</p> <p>Yes → Repair the open Brake Switch Sense circuit. Perform AW4 TRANS VERIFICATION TEST-VER1.</p> <p>No → Go To 4</p>	All
4	<p>Turn ignition off to the lock position. Disconnect the Brake Switch harness connector. Disconnect the TCM harness connector.</p> <p>NOTE: Check connectors - Clean/repair as necessary.</p> <p>Measure the resistance between ground and the Brake Switch Sense circuit. Is the resistance below 5.0 ohms?</p> <p>Yes → Repair the Brake Switch Sense circuit shorted to ground. Perform AW4 TRANS VERIFICATION TEST-VER1.</p> <p>No → Go To 5</p>	All

***NO BRAKE SWITCH INPUT TO TCM — Continued**

TEST	ACTION	APPLICABILITY
5	<p>Turn ignition off to the lock position. Disconnect the Brake Switch harness connector. NOTE: Check connectors - Clean/repair as necessary. Connect a jumper wire between Brake Switch Sense circuit and ground. Turn the ignition on. With the DRBIII® in Inputs/Outputs, read the Brake Switch state. While monitoring the DRBIII® Brake Switch State. Slowly and repeatedly tap the jumper wire to ground. Does the Brake Switch status switch from OFF to ON?</p> <p>Yes → Go To 6</p> <p>No → Replace the TCM. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All
6	<p>If there are no possible causes remaining, view repair.</p> <p>Repair</p> <p>Replace the brake switch. Perform AW4 TRANS VERIFICATION TEST-VER1.</p>	All

Symptom:***POOR SHIFT QUALITY**

POSSIBLE CAUSES
*POOR SHIFT QUALITY

Repair Instructions:***POOR SHIFT QUALITY**

Check the Transmission fluid level per the service information, check for TSB's, and check TCM Flash Version Level for latest release. Note: These are just some of the possible issues of poor shift quality that are sometimes overlooked.

Perform AW4 TRANS VERIFICATION TEST-VER1.

Verification Tests

AW4 TRANS VERIFICATION TEST-VER1	APPLICABILITY
<ol style="list-style-type: none"> 1. Connect the DRBIII® to the Data Link Connector (DLC). 2. Reconnect any disconnected components. 3. With the DRBIII®, erase all Transmission DTC's, also erase the PCM DTC's. 4. Check the transmission fluid and adjust if necessary. Refer to the Service Information for the Fluid Fill procedure. 5. Road test the vehicle. With the DRBIII®, monitor the engine RPM. Make 15 to 20 1-2, 2-3, 3-4 upshifts. Perform these shifts from a standing start to 45 MPH with a constant throttle opening of 20 to 25 degrees. 6. Below 25 MPH, make 5 to 8 wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown. 7. Attempt to reset the specific DTC, drive the vehicle to the When Monitored/When Set conditions for the DTC to verify the DTC is repaired.. 8. Check for Diagnostic Trouble Codes (DTC's) during the road test. If a DTC sets during the road test , return to the Symptom list and perform the diagnostics. 9. NOTE: Erase P0700 DTC in the PCM after making transmission repairs. This will turn the MIL off. <p>Were any DTC's set during the road test?</p> <p>Yes refer to the symptom list Repair is not complete, refer to appropriate symptom.</p> <p>No Test Complete Repair is complete.</p>	All
